Appendix 8 - Court of Appeal Judgement

Executive Summary

This report presents a Flood Risk Assessment in accordance with the National Planning Policy Framework and National Planning Practice Guidance: Flood Risk and Coastal Change ID: 7 guidance, for a proposed residential development located on land east of Halterworth Lane, Romsey, Hampshire.

The report includes an assessment of the surface water and foul drainage requirements of the Site and details the flood risk and how this could be managed and mitigated to allow the Site to be developed in support of the outline planning application.

Flood risk from identified sources can be mitigated to a negligible level through the following approach:

- No below surface habitable buildings (i.e. basements).
- Set finished floor levels above external levels.
- Adoption of a surface water management strategy.
- Provide a development free easement along onsite public foul water sewer assets, or re-direct around the Site boundary.

Flooding Source	Potential Source	Probability and Consequence / Impact Without Mitigation	Consequence & Impact with Mitigation
Fluvial	Tadburn Lake	Negligible	Negligible
Tidal	None identified	Negligible	Negligible
Groundwater	Secondary A Aquifer	Low below ground but Negligible above ground	Negligible
Surface Water	Site Topography	Negligible for most of the Site but Low where there is surface water ponding	Negligible
Sewers and Mains	Public Sewers	Negligible for most of the Site but Low along overland flow pathways	Negligible
Infrastructure Failure	None identified	Negligible	Negligible

The proposed residential use is classified as more vulnerable. More vulnerable uses are considered acceptable in terms of flood risk in Flood Zone 1 (low risk). Given that the proposed residential uses are solely located in Flood Zone 1, the Sequential Test Is not required (which is in accordance with the recent Court of Appeal judgement [Case No: C-2023-000087, dated 17th January 2024] – Appendix 8). Other potential sources of flooding have been considered and found to be negligible or low and can be managed using the above mitigation measures.

The FRA has considered the potential impact of the development on surface water runoff rates, given the increase in impermeable areas post-development. These rates have been calculated, and it has been demonstrated that surface water can be managed, such that flood risk to and from the Site following development will not increase. This will be achieved through restricted discharge rates (25.7l/s [QBAR]) and appropriately sized detention basins, with an outfall to the nearby public surface water sewer, as agreed with Southern Water. The northern parcel will

discharge to the surface water sewer along Jenner Way and the southern parcel will discharge to the surface water sewer along Benedict Close.

It is proposed that foul flows will discharge to Halterworth Lane via a pumped connection.

The FRA demonstrates the proposed development would be operated with minimal risk from flooding and would not increase flood risk elsewhere. The development should therefore not be precluded on the grounds of flood risk, as well as surface water and foul drainage.

1.0 Introduction

1.1 Background

1.1.1 Enzygo Ltd was commissioned by Gladman Developments Ltd to carry out a site-specific Flood Risk Assessment (FRA), including an outline surface water and foul drainage strategy, in support of an outline application for a proposed residential development. The Site is located on land east of Halterworth Lane, Romsey, Hampshire (the 'Site').

1.1.2 The proposal is for demolition of existing buildings and the erection of up to 270 dwellings, including affordable housing, with land for the potential future expansion of Halterworth Primary School, public open space, structural planting and landscaping, sustainable drainage system (SuDS) and vehicular access points. All matters reserved except for means of access.

1.1.3 A site-specific FRA assesses the current and future flood risk to and from a development site. It demonstrates how flood risk will be managed now and over the development's lifetime, taking climate change, drainage, and the vulnerability of its intended users into account.

1.1.4 The objectives of a site-specific FRA are to:

- Assess whether a proposed development is likely to be affected by current or future flooding from a range of sources.
- Assess whether the development will increase flood risk elsewhere.
- Decide on measures to deal with these effects and risks and assess their appropriateness.
- Provide enough evidence for the local planning authority to apply (if necessary) the Sequential Test.
- Decide whether the development will be safe and will pass the Exception Test if applicable.

1.1.5 In England, planning applications for development need an FRA[1] for most developments including:

- In Flood Zones 2 and 3 including minor development and change of use.
- Sites of 1ha or larger in Flood Zone 1.
- Sites of less than 1ha in Flood Zone 1, including change of use to a more vulnerable class (for example from commercial to residential), and where they could be affected by sources of flooding other than rivers and the sea.
- Land in Flood Zone 1 in a Critical Drainage Area (CDA) as notified by the Environment Agency.
- Land in Flood Zone 1 identified in a strategic flood risk assessment as being at increased flood risk in future.

1.1.6 An FRA is required for this development, as initial screening using Environment Agency online indicative flood mapping shows the Site is in Flood Zone 1 (low risk) but is more than 1ha and is at risk of surface water flooding.

[1] Department for Environment, Food & Rural Affairs and Environment Agency (published March 2014 and update February 2017). Flood Risk Assessments if You're Applying for Planning Permission [https://www.gov.uk/guidance/flood-risk-assessment-for-planning-applications].

1.1.7 The purpose of this FRA is to assess the risk of flooding to the proposed development and where possible provide sufficient mitigation to demonstrate that future users of the development would remain safe throughout its lifetime, that the development would not increase flood risk on Site and elsewhere and, where practicable, would reduce flood risk overall.

1.2 Scope

1.2.1 Government policy on development and flood risk is set out in the National Planning Policy Framework (NPPF) [2] and is supported by National Planning Practice Guidance: Flood Risk and Coastal Change [NPPG ID7] [3].

1.2.2 NPPF paragraphs 158-179 set out the need for an appropriate assessment of flood risk at all levels of the planning process and require the application of a sequential risk-based approach to assess the suitability of land for development in flood risk areas.

1.2.3 The FRA should also make allowances for climate change [4] to minimise vulnerability and provide resilience to flooding and coastal change in the future. The allowances are predictions of anticipated change in:

- Peak river flow by river basin district.
- Peak rainfall intensity.
- Sea level rise.
- Offshore wind speed and extreme wave height.

1.2.4 The allowances are based on climate change projections and different scenarios of carbon dioxide emissions to the atmosphere. There are different allowances for different periods of time over the next century.

1.2.5 Site-specific FRAs are categorised according to level. Simple Level 1 Screening studies give a general indication of the potential flood risk to a site and identify whether more detailed Level 2 assessment is required or not. A Level 2 assessment is a qualitative appraisal to develop understanding of flood risk to a site and the effects of the site on flooding elsewhere including recommended mitigation measures. Level 3 assessments are more detailed quantitative studies, for example modelling to establish flood levels at a site in the absence of Environment Agency or other data or providing detailed outline drainage designs.

1.2.6 This report is a Level 2 qualitative FRA, which includes a Level 3 assessment of the surface water and foul drainage requirements for the proposed development.

1.3 Aims

1.3.1 This FRA aims to provide enough flood risk information to satisfy the requirements of the NPPF, PPG ID7 and regional/local government plans and policies. It describes the potential for the Site to be impacted by flooding, the impacts of the proposed development on flooding

[2] Ministry of Housing, Communities & Local Government (published March 2012 and updated December 2023). National Planning Policy Framework [https://www.gov.uk/government/publications/national-planning-policy-framework--2].

elsewhere near the Site, and the proposed measures that could be incorporated into the development to mitigate the identified risks.

1.4 Planning Context

National Policy

1.4.1 The FRA was prepared in accordance with the NPPF and NPPG ID7.

Regional/Local Policy

1.4.2 The FRA considers the following policies within the Test Valley Borough Council Local Plan (2011 to 2029)[5]:

- Policy E7: Water Management – *Development will be permitted provided that it complies with national policy and guidance in relation to flood risk, and it does not risk the quality of groundwater.*

1.4.3 This FRA also considers the following flood risk and drainage guidance documents:

- Test Valley Borough Council Local Development Scheme (2022)[6].
- Test Valley Borough Council Strategic Flood Risk Assessment (SFRA) and associated mapping[7].

1.5 Report Structure

1.5.1 This report is structured as follows:

- Section 2 identifies the sources of information that were consulted.
- Section 3 describes the existing Site.
- Section 4 outlines the flood risk to the existing site and proposed development.
- Section 5 details the proposed mitigation measures against identified flooding sources.
- Section 6 assesses the surface water drainage requirements of the proposed development.
- Section 7 presents a summary and conclusions.

2.0 Sources of Information

2.1 Sources of Information

2.1.1 The following information was consulted:

- Ordnance Survey mapping (Drawings 001 and 002).
- Detailed topographic survey (Appendix 1).
- Environment Agency online mapping (Flood Map for Planning[8], Long Term Flood Risk Assessment for Locations in England[9], Catchment Data Explorer[10] and Main River Map[11]).
- Environment Agency Reduction in Risk of Flooding from Rivers and Sea online mapping[12].
- Online mapping for Climate Change Allowances for Peak River Flow and Peak Rainfall in England online mapping[13].
- National Soils Resources Institute (NSRI): Soilscapes online mapping[14].
- British Geological Survey [BGS] Geology Viewer online mapping[15].
- British Geological Survey [BGS] Borehole Records online mapping[16].
- Landmark's Promap: Flood Data package (see Drawings).
- Geosmart 1 in 100-year groundwater flood risk map (see Drawings).
- DEFRA's Magic Map for identifying Designated Sites[17].
- River Levels UK for identifying Flood Alert and Flood Warning areas[18].

2.2 Consultation and Discussion with Regulators

2.2.1 Consultation and discussions were undertaken with the relevant water regulators.

Environment Agency

2.2.2 The Environment Agency is a statutory consultee on flood risk and planning and is directly responsible for the prevention, mitigation, and remediation of flood damage for main rivers and coastal areas; and it has a strategic overview for all forms of flooding.

2.2.3 Environment Agency Standing Advice[19] and the NPPF/PPG ID: 7 was consulted and reviewed.

2.2.4 Correspondence with the Environment Agency is included in Appendix 3.

Lead Local Flood Authority

2.2.5 Hampshire County Council as the Lead Local Flood Authority (LLFA) is responsible for local flood risk management in their area and for maintaining a register of flood risk assets. They also have lead responsibility for managing the risk of flooding from surface water, groundwater, and ordinary watercourses.

2.2.6 Hampshire County Council online policies and guidance were consulted in order to inform this report. The surface water checklist and guidance were also checked.

Water Utility

2.2.7 Drainage and sewerage services in the UK are provided by a number of water and sewerage companies. Southern Water is responsible for sewerage within the area of the Site.

2.2.8 All sewerage undertakers maintain the 'DG5 register' of properties and external areas (such as gardens, highways, open spaces) which have suffered flooding from public foul/combined sewers. It does not include flooding caused by blockages.

2.2.9 Southern Water asset plans and pre-development enquiry response is included in Appendix 2.

2.3 Site Walkover

2.3.1 Enzygo staff carried out a walkover of the Site during March 2021. Observations made were used to inform the Site description.

3.0 Site Location and Description

3.1 Location

3.1.1 The Site is located on land east of Halterworth Lane, Romsey, Hampshire, SO51 9AE.

3.1.2 The Site is centred on National Grid Reference (NGR) 437481, 121399.

3.1.3 The 12.8ha Site location is shown in Drawing 001 and in more detail in Drawing 002.

3.2 Land Use

3.2.1 The land use is comprised of two agricultural (grassed) land parcels (Figures 3.1 and 3.2), hereafter referred to as the 'northern parcel' and the 'southern parcel'.

3.2.2 The Site is bounded by residential dwellings and Halterworth Lane to the west; residential dwellings and Halterworth Primary School to the south; and agricultural land to the north and east.

3.2.3 Vehicle access is currently via a gate off Halterworth Lane along the north-west and south-west of the Site. A footpath is also oriented west to east through the northern extents.

Figure 3.1: Photographs of the Site

Left: View looking north from the southern boundary. Right: View looking north-west from the north.

Figure 3.2: Aerial Photograph of the Site

Image © 2024 Digital Globe.

3.3 Topographic Information

3.3.1 A detailed topographic survey was carried out during June 2021 and a copy is included in Appendix 1.

3.3.2 The Northern Parcel generally falls in a west/north-west direction from 39.98 metres Above Ordnance Datum (m AOD) in the south-west corner, to 36.57m AOD in the north-west corner. The fall of 3.41m over 290m gives a gradient of 1:85.

3.3.3 The Southern Parcel generally falls west/south-west from 39.78m AOD along the eastern boundary, to 38.12m AOD along the south-west boundary. The fall of 1.66m over 313m gives a gradient of 1:189.

Figure 3.3: Summary of Site Topography

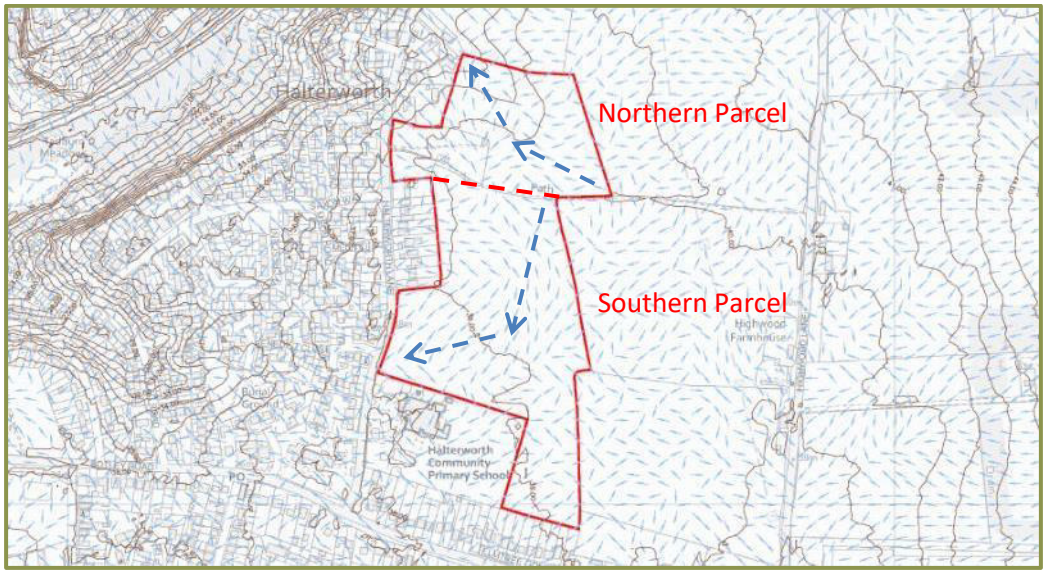

Table 3.1: Summary of Site Topography

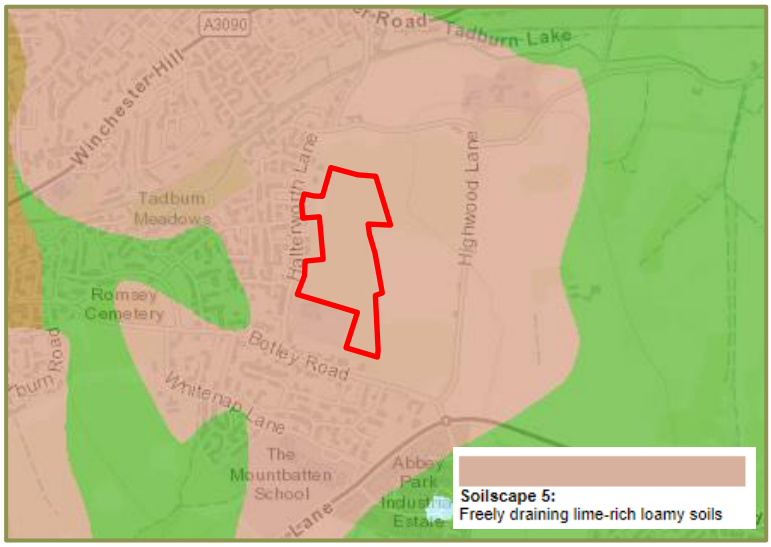
Land Parcel Reference	Direction of Fall	Maximum Elevation (m AOD)	Minimum Elevation (m AOD)	Distance (m)	Average Gradient Across Land Parcel
Northern	West/north-west	39.98	36.57	290	1:85
Southern	South/south-west	39.78	38.12	313	1:189

3.4 Soils and Geology

Soils Mapping

3.4.1 The online NSRI Soilscapes mapping (Figure 3.4) shows the Site is underlain by freely draining loamy soils.

Figure 3.4: Soils Mapping



Soils Data © Cranfield University (NSRI) and for the Controller of HMSO [2024].

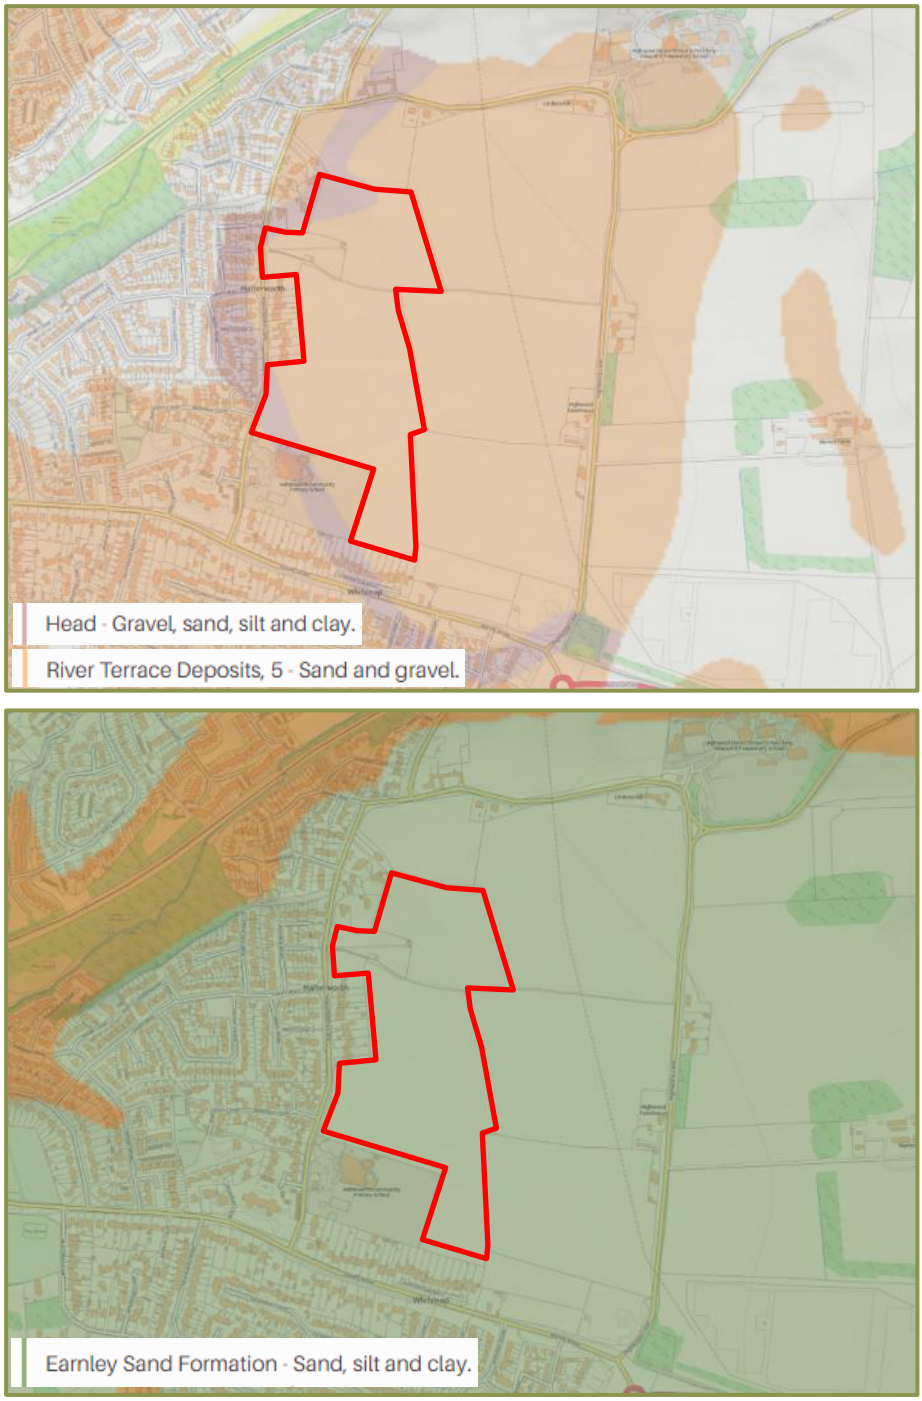
Geology Mapping

3.4.2 The online BGS Geology Viewer (Figure 3.5) shows most of the Site is underlain by River Terrace Deposits 5 - sand and gravel (superficial deposits). The south-west and north-west corners of the Site are underlain by a small band of Head - Gravel, sand, silt and clay.

3.4.3 The bedrock beneath the entire Site is Earnley Sand Formation - Sand, silt, and clay.

3.4.4 The geology mapping is indicative and there may be localised variation.

Figure 3.5: Geology Mapping

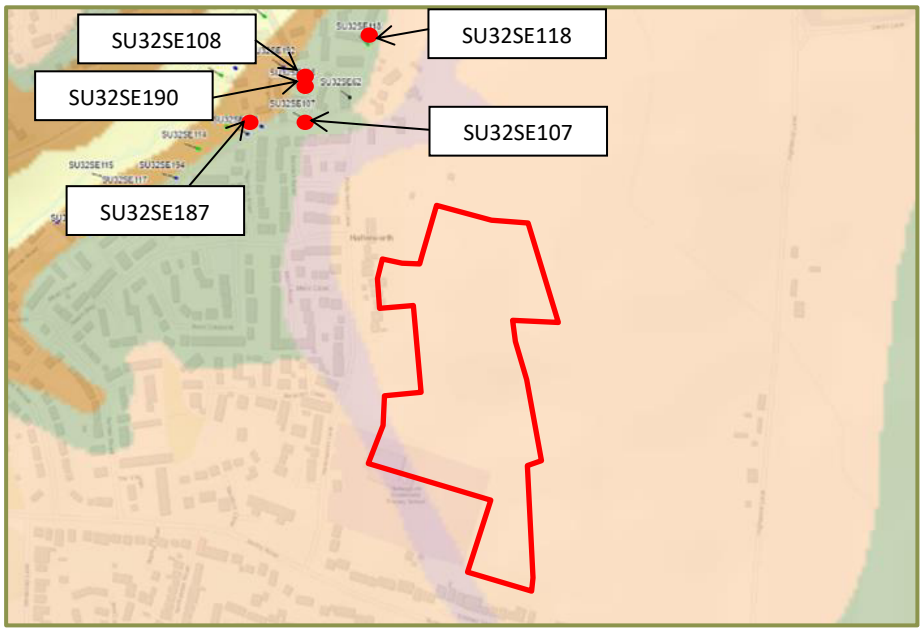


Top: Superficial deposits. Bottom: Bedrock geology. Contains British Geological Survey materials © NERC [2024].

BGS Borehole Records

3.4.5 The BGS Borehole Records online mapping (Figure 3.6) shows there are no historical boreholes located within the same mapped geology of the Site. There are however five borehole records within the same bedrock to the west of the Site, albeit in different superficial deposits. As such, only the groundwater depth has been noted (Table 3.2).

Figure 3.6: Borehole Mapping



Contains British Geological Survey materials © NERC [2024].

Table 3.2: BGS Borehole Data

Reference	Depth (m bgl)	Groundwater Depth (m bgl)
SU32SE107	10.95	16
SU32SE108	10	2.4
SU32SE118	10	1.3
SU32SE187	5.7	1.00 - 3.00
SU32SE190	2.5	Not Encountered

Contains British Geological Survey materials © NERC [2024].

Soakaway Testing

3.4.6 Soakaway testing was undertaken in accordance with DG365 'Soakaway Design' methodology guidance, during October 2023. A copy of the Soakaway Testing Results is included in Appendix 5.

3.4.7 A total of nine soakaway test pits and three boreholes were established across the Site, with focus on the topographic low points, where SuDS attenuation features would be positioned (Figure 3.7).

3.4.8 The borehole records confirm the soils and geology as depicted by the soils and geology mapping.

Figure 3.7: Trial Pit Location Plan

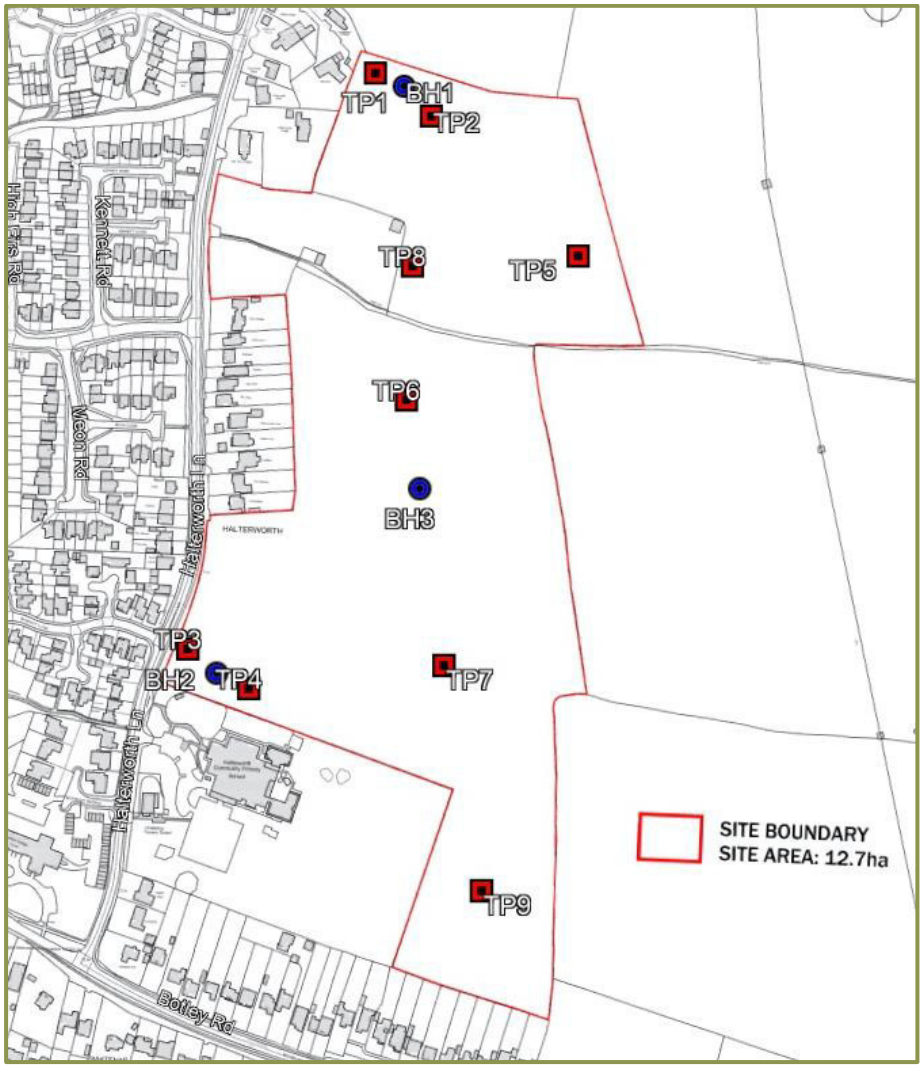


Table 3.3: Soakaway Data

Trial Pit	Depth (m bgl)	Soil Infiltration Rate (m/s)			Comments
		Test 1	Test 2	Test 3	
TP1	1.6	1.37E-04	1.43E-04	1.37E-04	Perched Groundwater at 1.5m bgl. Sand and sandstone deposits. Pit stable. Soil Horizon 0.3m.
TP2	1.5	n/a	n/a	n/a	Perched groundwater 1.2m - Pit unstable. Sandstone gravel and sand deposits. Water strike and pit collapse led to no infiltration calculations.
TP3	1.7	9.64E-04	6.46E-04	5.79E-04	Groundwater N/A. Sandstone gravel, clay and sand deposits with mudstone, siltstone and sandstone. Pit stable. Soil Horizon 0.25m.
TP4	1.6	4.09E-04	3.58E-04	2.63E-04	Groundwater N/A. Sandstone gravel, clay and sand deposits with mudstone, siltstone

					and sandstone. Pit stable. Soil Horizon 0.3m.
TP5	1.7	n/a	n/a	n/a	Groundwater N/A. Sandstone gravel, clay and sand deposits with mudstone, siltstone and sandstone. Pit stable. Soil Horizon 0.3m.
TP6	1.8	2.70E-05	2.23E-05	1.80E-05	Groundwater N/A. Sandstone gravel, clay and sand deposits with mudstone, siltstone and sandstone. Pit stable. Soil Horizon 0.2m.
TP7	1.6	1.52E-04	1.13E-04	1.00E-04	Groundwater N/A. Sandstone gravel, clay and sand deposits with mudstone, siltstone and sandstone. Pit stable. Soil Horizon 0.25m.
TP8	1.8	n/a	n/a	n/a	Groundwater N/A. Sandstone gravel, clay and sand deposits with mudstone, siltstone and sandstone. Pit stable. Soil Horizon 0.3m.
TP9	1.6	1.78E-04	1.43E-04	1.37E-04	Groundwater N/A. sandstone gravel, sand and silty sand. Pit stable. Soil Horizon 0.2m.
BH1	12	Test not run	n/a	n/a	Perched groundwater at 3m bgl, groundwater table at 12m bgl. Silty sand, gravel, clay, sand. Soil Horizon 0.4m.
BH2	7	2.82E-07	n/a	n/a	Perched groundwater at 4m bgl, groundwater table struck at 9m bgl. Sands and clays, mudstone, siltstone, sandstone. Pit stable. Tests 2 and 3 had insufficient uptake to calculate infiltration.
BH3	9	3.88e-07	n/a	n/a	Perched groundwater 4m bgl. Groundwater at 9.2m bgl. Sands, clays, and limestone gravel. Pit stable. Tests 2 and 3 had insufficient uptake to calculate infiltration.

3.5 Hydrogeology

Infiltration Potential

3.5.1 The SuDS Infiltration Potential Mapping (Drawing 005) shows most of the Site is in the mapped extent indicative of high potential. The north-west and south-west corners of the Site are in the mapped extent of moderate infiltration. The south-east corner is in the mapped extent of low infiltration potential.

3.5.2 The freely draining soils are indicative of high infiltration potential, but the infiltration potential of the bedrock is dependent on the composition of the sandstone and groundwater levels.

3.5.3 The north-west corner and south-east corners of the Site are within the mapped extent of moderate potential. The south-east corner is within the mapped extent of low potential.

3.5.4 Shallow soakaway testing demonstrated infiltration to be viable across most of the Site, with three successful runs undertaken in accordance with DG: 365 in TP1, TP3, TP4, TP6, TP7 and TP9.

3.5.5 Groundwater was encountered in BH1, BH2, BH3 and TP2. The initial groundwater was struck at depths of between 1.2-4m bgl, but it is noted that this is perched groundwater within the

superficial deposits. The groundwater table was encountered between 9-12m bgl. This was then followed up with groundwater monitoring.

Groundwater Monitoring

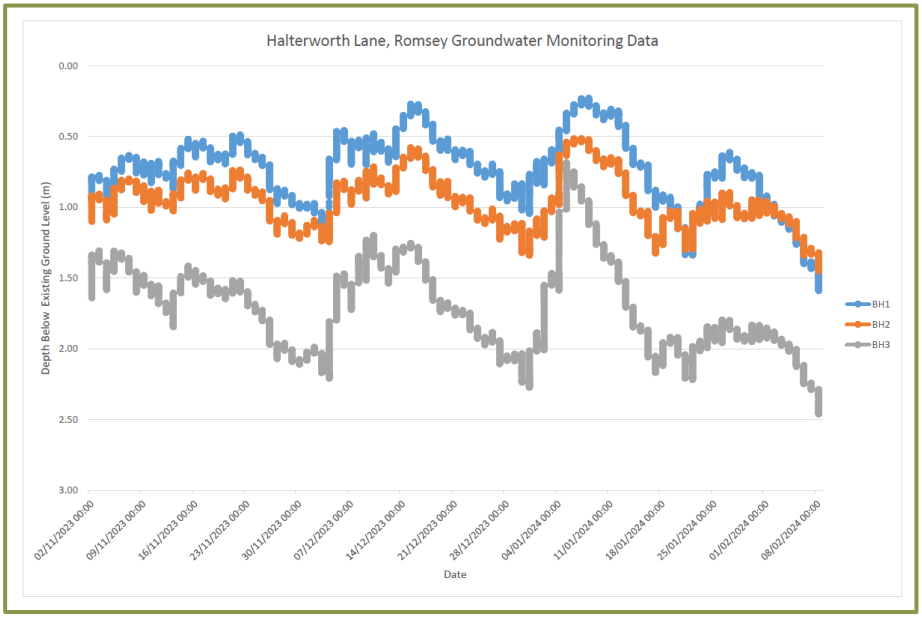
3.5.6 Groundwater monitoring was undertaken between November 2023 to April 2024 and a report is included in Appendix 6.

3.5.7 A location plan of the monitoring wells is included in Figure 3.7 and groundwater monitoring results are included in Figure 3.8.

3.5.8 Three monitoring wells were established across the Site, taking into consideration the topographic low points and position of the proposed developable area/SuDS attenuation features.

3.5.9 The results show that in BH1 groundwater was encountered between 0.23m and 1.59m bgl. In BH2 groundwater was encountered between depths of 0.51m and 1.45m bgl and in BH3 groundwater was encountered between 0.69m and 2.46m bgl.

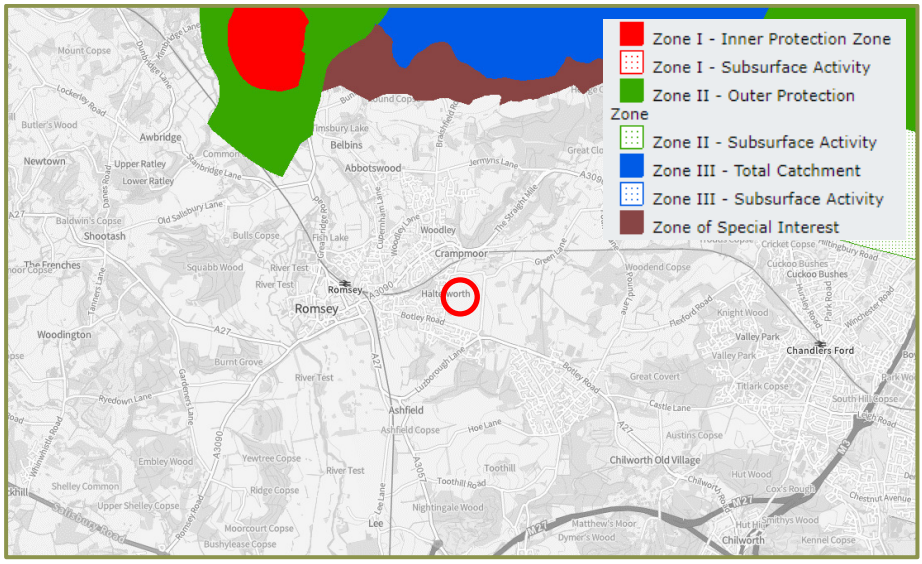
Figure 3.8: Groundwater Monitoring Results



Defra Magic Map

3.5.10 The online Defra Magic Map mapping (Figure 3.9) shows the Site is not located in a groundwater Source Protection Zone (SPZ).

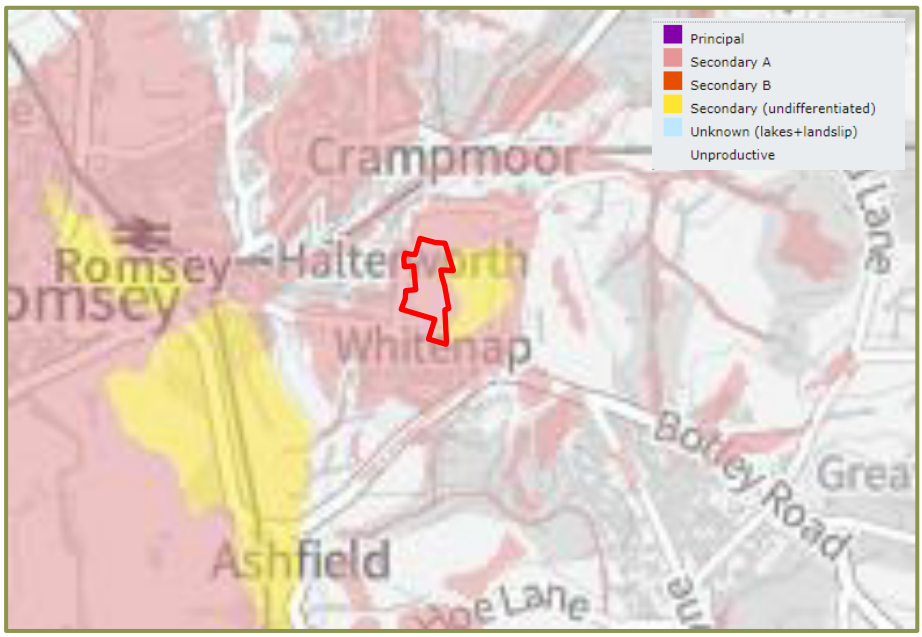
Figure 3.9: Source Protection Zone Map

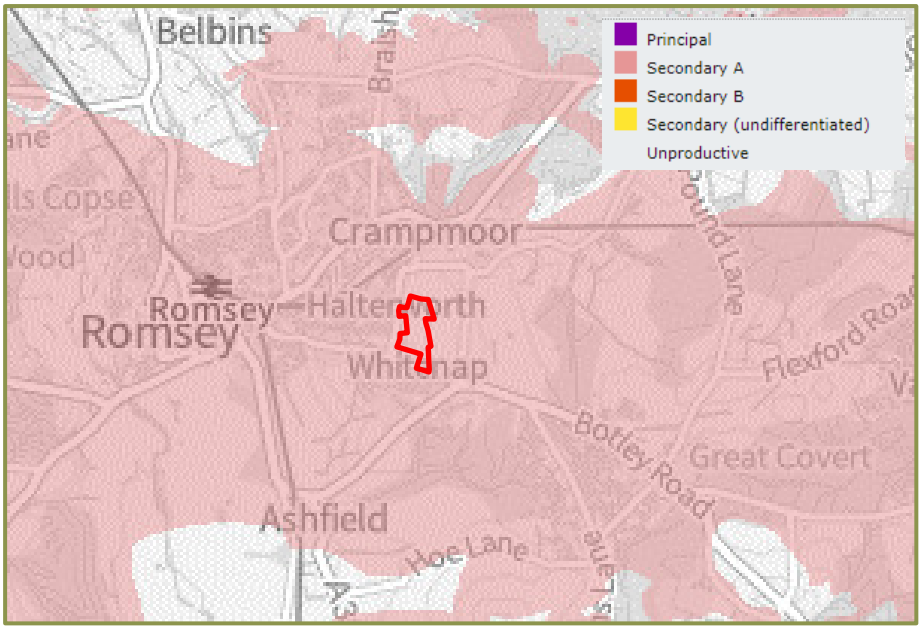


From Magic Map. Contains Environment Agency information © Environment Agency and database right [2024].

3.5.11 The Site is not located above a Principal Aquifer (bedrock designation) (Figure 3.10). The Site is however located above a Secondary A Aquifer (bedrock designation) and a Secondary A Aquifer (superficial drift). The eastern boundary is above a Secondary Undifferentiated Aquifer (superficial drift).

Figure 3.10: Aquifer Designation Map





Top: Aquifer Designation (superficial deposits). Bottom: Aquifer Designation (bedrock). From Magic Map. Contains Environment Agency information © Environment Agency and database right [2024].

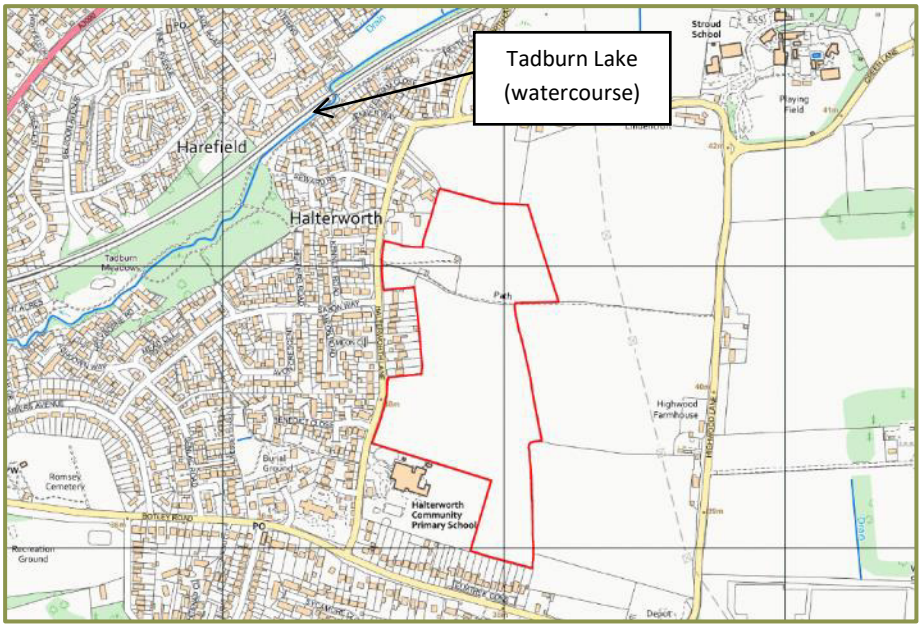
3.6 Catchment Hydrology

OS Mapping and Site Walkover Observations

3.6.1 OS mapping (Figure 3.11) shows Tadburn Lake (watercourse) conveying flows south-west, approximately 250m north-west of the Site at its closest point.

3.6.2 The Site walkover did not observe any onsite or bounding watercourses.

Figure 3.11: Map of Watercourses

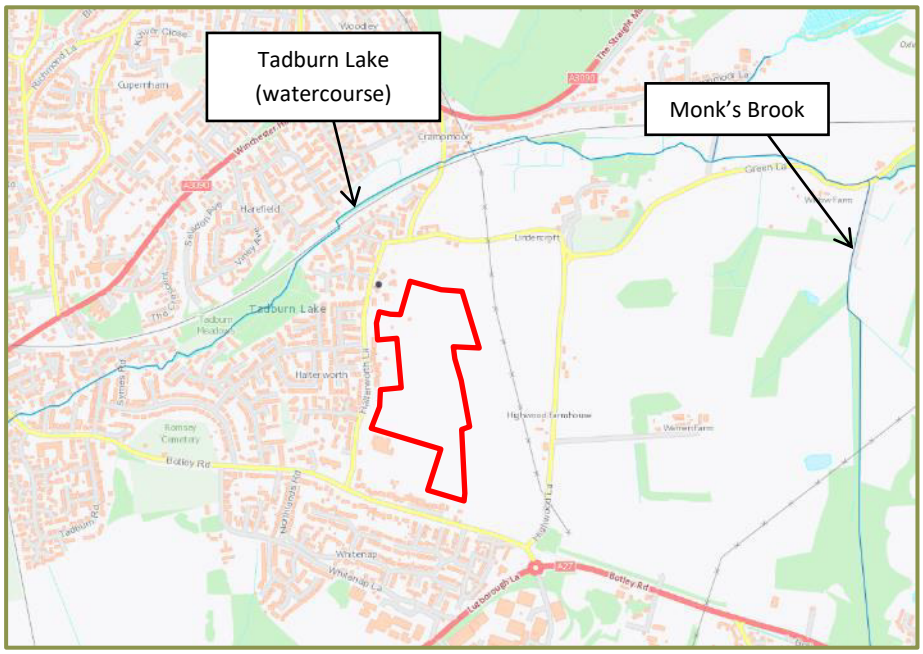


Main River Map

3.6.3 The Environment Agency online main river map (Figure 3.12) identifies the Tadburn Lake 'main river' approximately 250m north-west of the Site. Monk's Brook 'a main river' is located approximately 1.2km east of the Site. Monks Brook is a tributary of Tadburn Lake.

3.6.4 A main river is a watercourse where flood risk work is carried out by the Environment Agency.

Figure 3.12: Main River Map

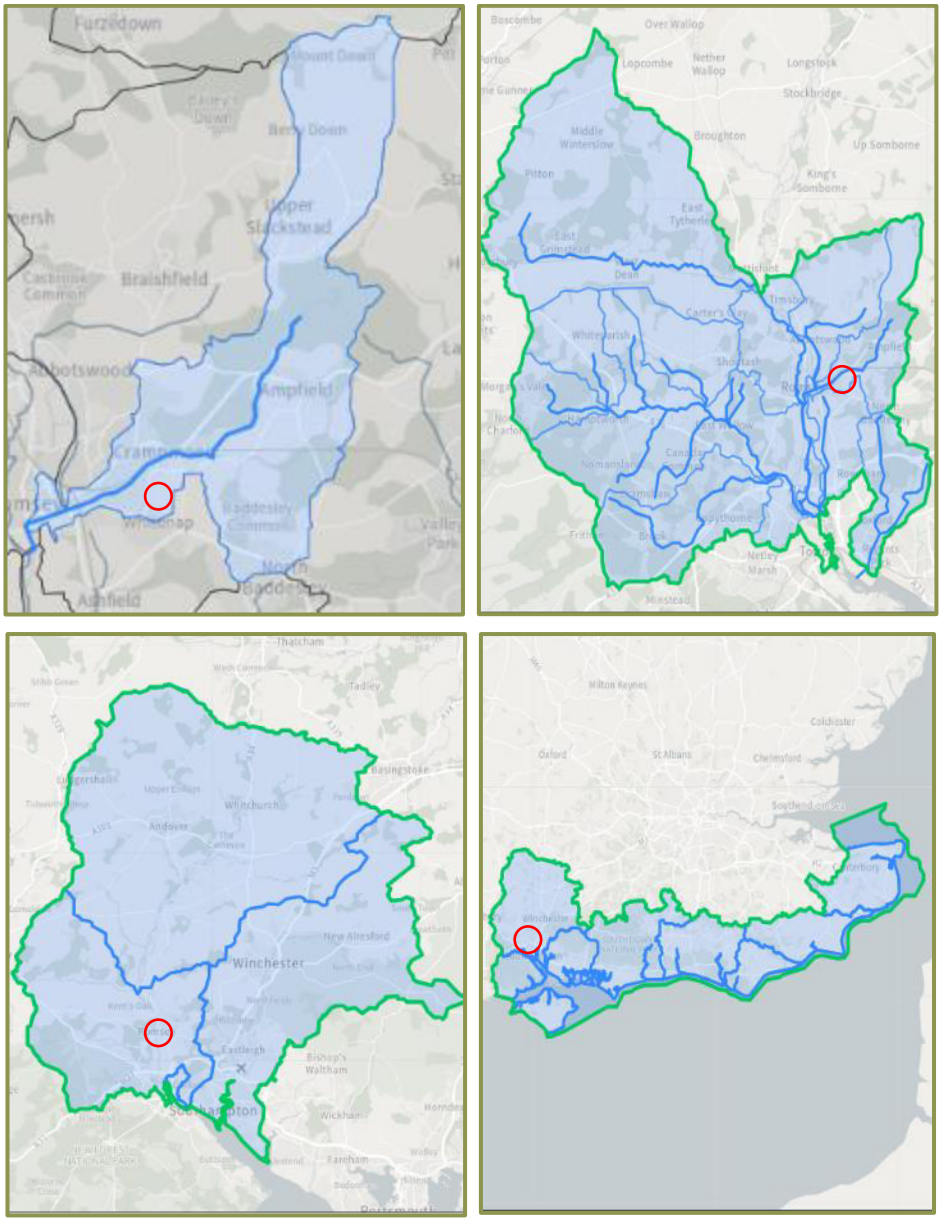


Contains Environment Agency information © Environment Agency and database right [2024].

Environment Agency Catchment Data Explorer Mapping

3.6.5 The Site resides within the Tadburn Lake Water Body (Figure 3.13), which is in the Test Lower and Southampton Streams Operational Catchment, Test and Itchen Management Catchment, and South East River Basin District.

Figure 3.13: Catchment Data Explorer



Top Left: Tadburn Lake Water Body. Top Right: Test Lower and Southampton Streams Operational Catchment. Bottom Left: Test and Itchen Management Catchment. Bottom Right: South East River Basin District. Contains Environment Agency information © Environment Agency and database right [2024].

3.7 Sewerage Assets

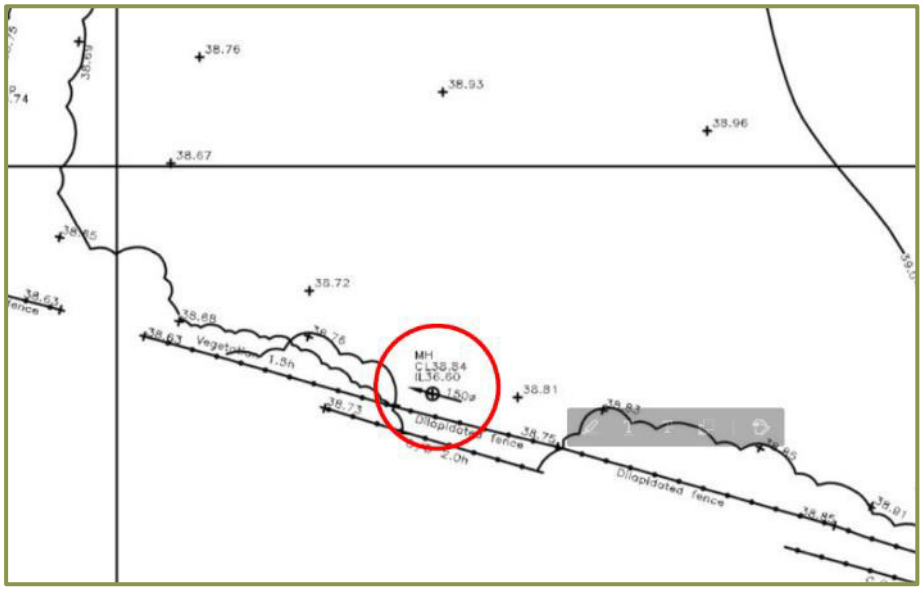
Public Assets

3.7.1 Southern Water assets plans show there is a Ø150mm public foul sewer network serving the residential dwellings to the west of the Site. The foul sewer is oriented north to south beneath Halterworth Lane.

3.7.2 The residential development west of Halterworth Lane is served by another Ø150mm public foul sewer network and a Ø150mm and Ø225mm public surface water network orientated east to west.

3.7.3 The residential dwellings to the south of the Site are served by a Ø150mm foul sewer. The topographic survey shows a manhole associated with this sewer (Figure 3.14), oriented north-west, just within the southern boundary of the Site.

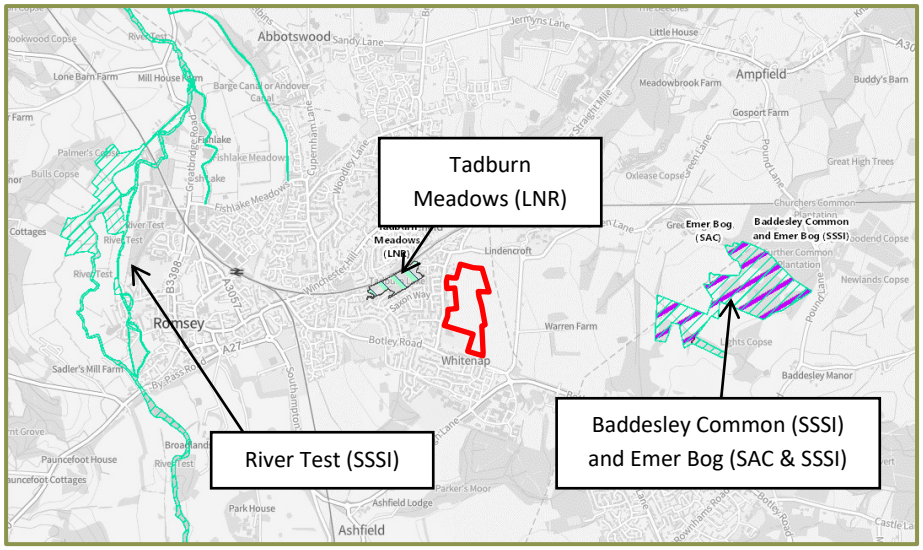
Figure 3.14: Topographic Survey Manhole



3.8 Designated Sites

3.8.1 The online Defra Magic Map mapping (Figure 3.15) shows the nearest designated sites include Tadburn Meadows (Local Nature Reserve [LNR]) located, located approximately 165m west of the Site, Baddesley Common and Emer Bog (Special Area of Conservation [SAC] & Site of Special Scientific Interest [SSSI]) located approximately 1.3km to the east of the Site, and the River Test (SSSI), located approximately 2.4km to the west of the Site. The Site is not hydrologically connected to either of these sites including downstream (from a flood risk and drainage perspective).

Figure 3.15: Designated Sites



From Magic Map. Contains Environment Agency information © Environment Agency and database right [2024].

4.0 Flood Risk Assessment

4.1 Potential Sources of Flooding

4.1.1 A summary of the potential sources of flooding and the potential risk posed by each source at the Site is presented in Table 4.1. Each source of flooding and level of risk is then assessed in further detail.

Table 4.1: Potential Risk Posed by Flooding Sources

Flooding Source	Potential Flood Risk at Application Site (Yes/No)	Potential Source	Data Sources
Fluvial	No	Tadburn Lake	Environment Agency consultation response (Appendix 3) and Environment Agency Flood Zone mapping (Drawing 003).
Tidal	No	None identified	Environment Agency consultation response (Appendix 3) and Environment Agency Flood Zone mapping (Drawing 003).
Groundwater	Yes	Secondary A Aquifer	Geosmart Groundwater (Drawing 004) and BGS Borehole Records (Appendix 4).
Surface Water	Yes	Site topography	Environment Agency Complex Surface Water Flood Mapping (Drawings 006.1 to 006.4).
Sewers and Mains	Yes	Public sewers	Southern Water asset plans (Appendix 2), and topographic survey (Appendix 1).
Infrastructure Failure	No	None identified	OS mapping (Drawings 001 to 002) and Environment Agency online mapping: Long Term Flood Risk Assessment for Locations in England.

4.2 Fluvial Flooding

Environment Agency Flood Zone Mapping

4.2.1 The Environment Agency Flood Zones are the current best information on the extent of the extremes of flooding from rivers or the sea that would occur without the presence of flood defences, since these can be breached, overtopped and may not be in existence for the lifetime of a development.

4.2.2 The Environment Agency Flood Zone mapping (Drawing 003) shows the Site is in Flood Zone 1, which is land outside the 1 in 1000-year 0.1% Annual Exceedance Probability [AEP]) extent of fluvial (river) flooding, at 'low' risk.

Modelled Flood Levels and Flood Outline Mapping

4.2.3 The Environment Agency provided modelled flood levels for Tadburn Lake sourced from the Romsey Model (2011). A range of return periods were provided, including the 1 in 100-year and 1000-year event, for nodes adjacent to the Site.

4.2.4 The model shows the Site is not inundated and sits at a minimum level of 36.57m AOD, which is 11.94m above the worse-case (1 in 100-year) modelled flood level.

Flood History

4.2.5 Correspondence with the Environment Agency (Appendix 3) reported no historical fluvial flooding incidents within the Site boundary or immediate vicinity.

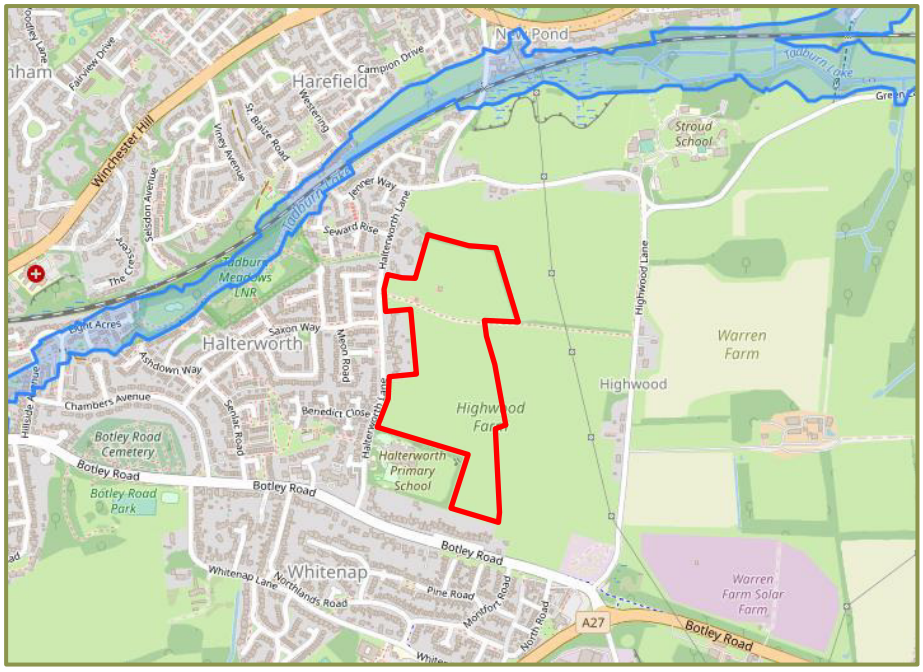
Flood Defences

4.2.6 The Environment Agency Reduction in Risk of Flooding from Rivers and Sea online mapping shows the Site does benefit from flood defences.

Flood Warning Service

4.2.7 The River Levels UK website (Figure 4.1) shows the Site is not within an area which receives flood warnings. The area along the reach of Tadburn Lake does receive flood warnings.

Figure 4.1: Flood Warning Areas



River Levels UK [2024].

Flood Risk Summary

4.2.8 The risk of fluvial flooding is assessed as negligible.

4.3 Tidal Flooding

Environment Agency Flood Zone Mapping

4.3.1 The Environment Agency Flood Zone mapping (Drawing 003) shows the Site is in Flood Zone 1, which is land outside the 1 in 1000-year 0.1% Annual Exceedance Probability [AEP]) extent of tidal (sea) flooding, at 'low' risk.

Flood Risk Summary

4.3.2 The risk of tidal flooding is assessed as negligible.

4.4 Groundwater Flooding

Introduction

4.4.1 Groundwater flooding occurs when subsurface water emerges either at surface or in made ground or in subsurface structures such as basements and services ducts. It occurs as diffuse seepage, emergence from new point source springs or an increase in flow from existing springs. It results from aquifer recharge from infiltrating rainfall, from sinking streams entering aquifers from adjacent non-aquifers, or from high river levels or tides driving water through near surface deposits. It tends to occur with a delay following rainfall and can last for several weeks or months. Groundwater flooding or shallow water tables also prevent or reduce infiltration and so can worsen surface water flooding.

Geosmart Groundwater Flood Risk Map

4.4.2 The Geosmart 1 in 100-year groundwater flood risk map (Drawing 004) shows the Site is at negligible risk of groundwater flooding and falls within Risk Class 4 (Table 4.2).

4.4.3 Mapped classes combine understanding of likelihood, model and data uncertainty, and possible severity. Likelihood is ranked according to whether we expect groundwater flooding at a site due to extreme elevated groundwater levels with an annual probability of occurrence greater than 1%, considering model and data uncertainty. Severity relates to expectations of the amount of property damage or other harm that groundwater flooding at that location might cause (Table 4.2).

Table 4.2: Groundwater Flood Risk Classification

Risk Class	Probability of Groundwater Flooding	Effect
4: Negligible	Annual probability less than 1%.	Negligible unless unusually sensitive use.
3: Low	Annual probability greater than 1%.	Remote possibility of damage to property or harm to sensitive receptors Flooding likely to be limited to seepages and waterlogged ground, damage to basements and subsurface infrastructure, and should pose no significant risk to life. Surface water flooding may be worsened.
2: Moderate	Annual probability greater than 1%.	Significant possibility of damage to property or harm to other sensitive receptors at or near this location. flooding is likely to be in the form of shallow pools or streams. Surface water flooding and failure of drainage systems may be worsened when groundwater levels are high.
1: High	Annual probability greater than 1%.	Groundwater flooding will occur which could lead to damage to property or harm to other sensitive receptors at or near this location. Flooding may result in damage to property, road, or rail closures and, in exceptional cases, may pose a risk to life.

Risk Class	Probability of Groundwater Flooding	Effect
		Surface water flooding and failure of drainage systems may be worsened when groundwater levels are high.

Borehole Records and Soakaway Testing Results

4.4.1 BGS online borehole mapping recorded groundwater ingress at depths between 1.3m bgl to 10.05m bgl in the bedrock deposits.

4.4.2 Soakaway testing encountered perched groundwater ingress in one pit at 1.2m bgl.

4.4.3 Groundwater monitoring encountered groundwater between 0.23m and 2.46m bgl.

Flood Risk Summary

4.4.4 The risk of groundwater flooding is assessed as low below ground in the perched groundwater but negligible above ground.

4.5 Surface Water Flooding

Introduction

4.5.1 Surface water flooding occurs following rainfall on ground where infiltration rates are less than the rainfall precipitation rate. This can occur when either:

- Soils or ground materials are naturally of low permeability or have been compacted (infiltration excess runoff).
- Soils or ground materials are saturated from previous rainfall either directly or from upslope (saturation excess runoff and return flow) or from high groundwater levels.

Environment Agency Complex Surface Water Flood Mapping

4.5.2 The Environment Agency Complex Surface Water Flood Mapping (Drawings 006.1 to 006.4) shows most of the Site is located outside the mapped extent of surface water flooding.

4.5.3 There is an area of surface water ponding in the south-west extent of the Site associated with the 1 in 1000-year event. Flood depths are up to 0.30m, velocities are up to 0.25m/s and the hazard is assessed as 'low' (0.50-0.75). Surface water ponding is associated with a topographic low spot.

Flood Risk

4.5.4 The risk of surface water flooding is assessed as negligible for most of the Site, with an area of low risk associated with surface water ponding.

4.5.5 Mitigation measures against surface water flooding are discussed in Section 5.

4.6 Sewer Flooding

Introduction

4.6.1 Sewer flooding occurs when urban drainage networks become overwhelmed after heavy or prolonged rainfall due to restrictions or blockage in the sewer network or if the volume of water draining into the system exceeds the sewer design capacity.

4.6.2 New adoptable sewers are built to have a minimum design standard up to and including the 1 in 30-year rainfall event. Older sewers were not designed to any standard. Modern sewer systems will only surcharge during rainstorm events with a return period greater than 1 in 30-years (e.g. 1 in 100-years).

Asset Plans

4.6.3 Southern Water asset plans (Appendix 2) show there is a Ø150mm public foul sewer orientated north-west just within the southern boundary of the Site. Any surcharged flows would be shallow (<150mm) and would shed overland, following the localised topography (Drawing 007).

Flood Risk

4.6.4 The risk of flooding from sewers is assessed as negligible for most of the Site but low along the reach of the foul sewer.

4.7 Flooding from Infrastructure Failure

Reservoir Failure

4.7.1 The Environment Agency online flood mapping shows the Site is outside the extent of flooding sourced from reservoirs. The risk of flooding from reservoirs is assessed as negligible.

5.0 Flood Risk Mitigation Measures

5.1 Introduction

5.1.1 The following sources of flooding were identified:

- Groundwater flooding (below ground).
- Surface water flooding (ponding).
- Sewer flooding (surcharged flows from public assets).

5.2 Mitigation Measures

Groundwater Flooding

- No below surface habitable buildings (i.e. basements).
- Set finished floor levels a minimum of +150mm above external levels.

Surface Water Flooding

- Adoption of a surface water management strategy.
- Set finished floor levels as per above.

Sewer Flooding

- Provide a development free easement (3m either side) of onsite public foul water sewer assets, or re-direct around the Site boundary.

5.3 Sequential Approach or Sequential Test Considerations

5.3.1 The proposed residential use is classified as more vulnerable. More vulnerable uses are considered acceptable in terms of flood risk in Flood Zone 1 (low risk). Given that the proposed residential uses are solely located in Flood Zone 1, the Sequential Test is not required (which is in accordance with the recent Court of Appeal judgement [Case No: CA-2023-000087, dated 17th January 2024] - Appendix 8. Other potential sources of flooding have been considered and found to be negligible or low and can be managed using the above mitigation measures.

Table 5.1: Probability and Consequences of All Sources of Flooding

Flooding Source	Potential Source	Probability and Consequence / Impact Without Mitigation	Consequence & Impact With Mitigation	Sequential Approach and Sequential Test Considerations
Fluvial	Tadburn Lake	Negligible	Negligible	The Site is entirely in Flood Zone 1 (low risk), therefore the requirement for the Sequential Test is not triggered.
Tidal	None identified	Negligible	Negligible	The Site is entirely in Flood Zone 1 (low risk), therefore the requirement for the Sequential Test is not triggered.
Groundwater	Secondary A Aquifer	Low below ground but Negligible above ground	Low below ground but Negligible above ground	There is no above ground risk but low below ground risk of groundwater flooding (nearby boreholes encountered groundwater at 1.3mbgl, onsite soakaway testing encountered groundwater at depths of 1.2mbgl). However, this will be mitigated by no below surface habitable buildings and raising finished floor levels above external levels. As per the recent CoA Judgement, the Sequential Test is not applicable to this aspect.
Surface Water	Site Topography	Negligible for most of the Site but Low where there is surface water ponding	Negligible for most of the Site but Low where there is surface water ponding	There are no surface water flow pathways within or bounding the Site. There is a minor risk from surface water ponding which will be mitigated with the adoption of a surface water management strategy. As per the recent CoA Judgement, the Sequential Test is not applicable to this aspect.
Sewers and Mains	Public Sewers	Negligible for most of the Site but Low along overland flow pathways	Negligible for most of the Site but Low along overland flow pathways	There is an onsite public foul sewer in which flood risk can be mitigated through appropriately sized easements. As per the CoA Judgement, the Sequential Test is not applicable to this aspect.
Infrastructure Failure	None identified	Negligible	Negligible	The Site is located entirely outside the mapped extent of flooding sourced from reservoirs and is not in the vicinity of any ponds or highway infrastructure.

Key: Green - Negligible, Yellow - Low, Orange - Medium and Red - High; based on consequence and impact with mitigation from each flooding source.

6.0 Site Drainage

6.1 Surface Water Drainage

6.1.1 Consideration of flood issues is not confined to the floodplain. This is recognised in the NPPF and associated guidance where all proposed development of 1ha or more in Flood Zone 1 and so outside the floodplain nevertheless requires an FRA. The alteration of natural surface water flow patterns through development can lead to problems elsewhere in a catchment, particularly flooding downstream, and the replacement of permeable vegetated areas by low-permeability roofs, roads and other paved surfaces will increase the speed, volume, and peak flow of surface water runoff. So, the NPPF and associated guidance require an FRA for all proposed development of 1ha or more outside the floodplain in Flood Zone 1.

6.1.2 A surface water management strategy for the development is proposed to manage and reduce the flood risk posed by surface water runoff from the Site. The developer will be required to ensure that any scheme for surface water management should build in enough capacity for the entire Site.

6.1.3 The surface water drainage arrangements for any development Site should be such that the volume and peak flow rates of surface water leaving a developed Site are no greater than the rates prior to the proposed development unless specific off-Site arrangements are made and result in the same net effect.

6.1.4 An assessment of the surface water runoff rates was undertaken to determine the surface water options and attenuation requirements for the Site.

6.2 Existing Drainage System

6.2.1 The 12.8ha Site is comprised of two agricultural (grassed) land parcels.

6.2.2 The Site is underlain by freely draining loamy soils above River Terrace Deposits 5 - Sand and gravel. Drainage is predominantly via overland flow, following the topography of the Site to the topographic low points, with a small amount of infiltration to bedrock.

6.3 Developable and Impermeable Areas

6.3.1 The proposal is for an outline planning application of up to 270 dwellings on the 12.8ha Site, including affordable housing, with land for the potential future expansion of Halterworth Primary School, public open space, structural planting and landscaping, sustainable drainage system (SuDS) and vehicular access points.

6.3.2 An allowance of 55% impermeable area (inclusive of 10% urban creep) was applied to the 7.26ha residential developable area. The existing and proposed impermeable areas are shown in table 6.1.

6.3.3 The proposed development will increase the impermeable surfaces and so increase the amount of runoff.

Table 6.1: Impermeable Area

Area	Existing Buildings and Hardstanding	Proposed Buildings and Hardstanding	Difference
Area (ha)	0	3.99	+3.99
Percentage of Total Site Area (%)	0	31.2	+31.2

6.4 Greenfield Runoff Rates

6.4.1 An assessment of greenfield runoff rates was undertaken to determine the attenuation requirements for the proposed development.

6.4.2 The runoff rates were calculated using the HRWallingford UKSuDS online tool, with FEH method inputs (descriptors obtained from the FEH webservice[20]). This is a recommended methodology for Sites up to 50ha in area and the approach is in line with the current 'industry best practice' guidelines as outlined in the Interim Code of Practice for SuDS[21], and Environment Agency Report SC030219 - Rainfall runoff management for developments.

6.4.3 It is anticipated that the area for expansion of the school development will be left as open space for the time being, any future development / expansions would be served by a specific drainage system installed as part of the future works. Therefore, it has been classified as greenfield land for the purposes of this assessment.

6.4.4 The following parameters were used in the runoff calculations:

- Developable Area: 7.26ha (includes parking and access roads).
- Average Annual Rainfall (SAAR): 788mm/year
- Region No.: 7
- BFIHOST19: 0.573

6.4.5 BFIHOST was updated to BFIHOST19 (November 2019) since a number of issues were identified with BFIHOST, which including a tendency to underestimate BFI in clay-dominated catchments.

6.4.6 BFIHOST19 is the baseflow index developed using the Hydrology of Soil Types (HOST) classification and is the baseflow proportion of the flow on average. It is estimated based on the daily mean flow data. Baseflow comprises water entering the watercourse through shallow subsurface flow and groundwater flow (mechanisms other than direct surface runoff); hence permeable soils and geology tend to yield a higher baseflow.

6.4.7 The Soilscapes online soils map viewer and Geology of Britain online map viewer identified the following, which were confirmed by soakaway testing trial pit logs (Appendix 5):

- Soils: freely draining loamy soils
- Superficial Deposits: River Terrace Deposits 5 - Sand and gravel
- Bedrock: Earnley Sand Formation - Sand, silt, and clay

6.4.8 BFIHOST19 value assigned by the FEH webservice is considered to replicate on-site conditions.

[20] Centre for Ecology and Hydrology, Flood Estimation Handbook Web Service [https://fehweb.ceh.ac.uk/].
[21] Office of the Deputy Prime Minister, National SuDS Working Group (July 2004) Interim Code of Practice for Sustainable Drainage Systems [https://www.susdrain.org/files/resources/other-guidance/nswg_icop_for_suds_0704.pdf].

6.4.9 Table 6.2 shows the calculated greenfield runoff rates. Runoff calculations are included in Appendix 7.

Table 6.2: Greenfield Runoff Rates

Annual Probability (Return Period, Years)	Greenfield Runoff (l/s)
QBAR	25.7
100% (1)	21.8
3.33% (30)	59.0
1% (100)	81.8
1% Plus Climate Change	114.5

Note: 45% climate change added. The 1 in 1-year, 30-year and 100-year annual probability events are of importance to the Water Companies and the Environment Agency when looking at sewage discharge and flood risk.

6.5 Sustainable Drainage Options (SuDS)

Feasibility of SuDS

6.5.1 Shallow and borehole soakaway testing was undertaken during October 2023. A copy of the soakaway testing is included in Appendix 5. Findings demonstrate good infiltration potential, however, they also demonstrated high groundwater levels across the Site. Soakaways require a 1m clearance between the base of the soakaway and the groundwater table and therefore would not be a viable means of discharge.

Choice of SuDS Options

6.5.2 Sustainable water management measures should be used to control the surface water runoff from the proposed development Site, thereby managing the flood risk to the Site and surrounding areas from surface water runoff. These measures will also improve the quality of water discharged from the Site.

6.5.3 Current guidance promotes sustainable water management using SuDS. Options applicable to this Site are identified in Table 6.3.

Table 6.3: SuDS Options

Green roofs	Infiltration basins
Water butts	Detention basins
Permeable paving	Oversized pipes
Rainwater harvesting	Brown roofs
Filter strips	Swales
Wetland Areas	Cellular Storage

Note: SuDS appropriate to the development are highlighted green.

6.5.4 A hierarchy of SuDS techniques is identified[22]:

1. **Prevention** - the use of good Site design and housekeeping measures on individual Sites to prevent runoff and pollution (e.g. minimise areas of hard standing).
2. **Source Control** - control of runoff at or very near its source (such as the use of rainwater harvesting).
3. **Site Control** - management of water from several sub-catchments (including routing water from roofs and car parks to one/several large soakaways for the whole Site).
4. **Regional Control** - management of runoff from several Sites, typically in a detention pond or wetland.

6.5.5 Using SuDS as opposed to conventional drainage systems provides several benefits by:

- Reducing peak flows to watercourses or sewers and potentially reducing the risk of flooding downstream.
- Reducing the volumes and frequency of water flowing directly to watercourses or sewers from developed Sites.
- Improving water quality over conventional surface water sewers by removing pollutants from diffuse pollutant sources.
- Reducing potable water demand through rainwater harvesting.
- Improving amenity through the provision of public open spaces and wildlife habitat.
- Replicating natural drainage patterns, including the recharge of groundwater so that base flows are maintained.

SuDS Maintenance

6.5.6 Two detention basins will form the main attenuation feature within the development Site.

6.5.7 Maintenance of the SuDS features would be in line with the SuDS Manual (CIRIA C753, 2015), as detailed in Figure 6.1. It is standard for SuDS features within a new development to be maintained by a private maintenance company unless the council adopt it. This will ensure maintenance throughout the lifetime of the development.

6.5.8 Details of other SuDS features and maintenance would be considered further at detailed design when a detailed layout has been produced. The level of detailed provided within this FRA should be sufficient at outline stage to demonstrate that SuDS would be deliverable.

[22] CIRIA (2004) Report C609, Sustainable Drainage Systems – Hydraulic, Structural and Water Quality advice.

Figure 6.1: Detention Basin Operation and Maintenance Requirements (Table 22.1 of the SuDS Manual)

TABLE 22.1 Operation and maintenance requirements for detention basins

Maintenance schedule	Required action	Typical frequency
Regular maintenance	Remove litter and debris	Monthly
	Cut grass – for spillways and access routes	Monthly (during growing season), or as required
	Cut grass – meadow grass in and around basin	Half yearly (spring – before nesting season, and autumn)
	Manage other vegetation and remove nuisance plants	Monthly (at start, then as required)
	Inspect inlets, outlets and overflows for blockages, and clear if required.	Monthly
	Inspect banksides, structures, pipework etc for evidence of physical damage	Monthly
	Inspect inlets and facility surface for silt accumulation. Establish appropriate silt removal frequencies.	Monthly (for first year), then annually or as required
	Check any penstocks and other mechanical devices	Annually
	Tidy all dead growth before start of growing season	Annually
	Remove sediment from inlets, outlet and forebay	Annually (or as required)
	Manage wetland plants in outlet pool – where provided	Annually (as set out in Chapter 23)
Occasional maintenance	Reseed areas of poor vegetation growth	As required
	Prune and trim any trees and remove cuttings	Every 2 years, or as required
	Remove sediment from inlets, outlets, forebay and main basin when required	Every 5 years, or as required (likely to be minimal requirements where effective upstream source control is provided)
Remedial actions	Repair erosion or other damage by reseeding or re-turfing	As required
	Realignment of rip-rap	As required
	Repair/rehabilitation of inlets, outlets and overflows	As required
	Relevel uneven surfaces and reinstate design levels	As required

Drainage Design Summary

6.5.9 Surface water runoff would be directed to the drainage system through drainage gullies located around the perimeter of the buildings and through contouring of the hardstanding areas.

6.5.10 Landscaped areas should be incorporated into the layout where possible, and the associated gardens of each unit will allow a proportion of the rainfall to infiltrate into the soil substrate.

6.5.11 Surface water will be directed to onsite detention basins, positioned to achieve a gravity connection from the developable area and a gravity connection to surface water sewer.

6.5.1 An indicative drainage layout is included in Drawing ENZ-XX-XX-DR-D-0001.

Attenuation Requirements

6.5.2 Attenuation storage is required to reduce the post-application surface water runoff from the Site to calculated greenfield runoff rates, up to and including the 1 in 100-year (+45%CC) rainfall event.

6.5.3 The Site naturally drains in two directions with a ridge line roughly in the centre of the Site. As such 55% of the catchment drains in a northerly direction and 45% in a southerly direction. This has been replicated in the drainage strategy to replicate existing conditions and provide a gravity system.

6.5.4 The following input parameters were assumed in the calculations:

- Impermeable Area: 4ha (38.2%);
  - Northern Basin: 2.2ha
  - Southern Basin: 1.8ha
- Cv (proportion of rainfall forming surface water runoff): 75% summer, 84% winter;
- Infiltration losses:
  - Northern Basin: 0m/hour.
  - Southern Basin: 0m/hour.

6.5.5 The attenuation volume for the 1 in 100-year event (plus climate change) is:

- Northern Basin: 1730m^3
- Southern Basin: 1402m^3

6.5.6 The outfall rates for the detention basins are:

- Northern Basin: 12.05l/s
- Southern Basin: 9.86l/s

6.5.7 Attenuation calculations are included in Appendix 7. The calculated runoff rates and attenuation volumes will be reviewed at detailed design stage.

6.5.8 A pre-development enquiry with Southern Water (Appendix 2) confirmed that there is adequate capacity within their system at m/h 3753 along Jenner Way (Northern Basin) and m/h 2251 along Benedict Close (Southern Basin).

6.6 Exceedance Routes

6.6.1 The detention basins will be designed with a capacity up to a 1 in 100-year (plus 45% climate change) event, with a +300mm freeboard allowance, based on both restricted discharge rates. This provides a betterment (reduction) in runoff when compared to existing undeveloped conditions, where runoff is uncontrolled across all return periods.

6.6.2 A storm event in excess of this design standard would be extreme and would cause the detention basins to surcharge and overtop (with no sudden deluge) and would then shed overland following the topography, as per existing conditions (Drawing 007).

6.6.3 Finished floor levels of new dwellings will be set above external levels, which will mitigate the residual risk of overtopping.

6.7 Foul Drainage

6.7.1 It is proposed that foul flow is discharged to the Ø150mm public foul sewer along Halterworth Lane at MH2503. The topography of the Site would require a pumped connection.

6.7.2 Correspondence with Southern Water confirmed that there is adequate capacity in the local sewerage network to accommodate a foul flow of 3.44l/s at manhole 2503. There is not currently capacity at manholes 2101 or 4901.

6.7.3 An outline foul drainage layout is in Drawing ENZ-XX-XX-DR-D-0001.

6.7.4 All foul sewerage should be designed in accordance with Building Regulations Part H[23]. In areas where sewers are to be adopted by Southern Water, sewerage should be designed in accordance with Design and Construction Guidance document and supplemented with additional standards provided by Southern Water. An application to enter into a Section 104 agreement for sewer adoption must be made in writing to Southern Water prior to any works commencing on Site. A connection point should be agreed with Southern Water.

[23] HM Government (published 2002 and updated October 2015) The Buildings Regulations 2010 - Drainage and Waste Disposal: Part H [https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/442889/BR_PDF_AD_H_2015.pdf].

7.0 Summary and Conclusions

7.1 Introduction

7.1.1 A site-specific Flood Risk Assessment (FRA) has been undertaken for a proposed residential development, located on a 12.8ha Site located on land east of Halterworth Lane, Romsey, Hampshire.

7.2 Flood Risk

7.2.1 The risk of flooding is assessed as follows:

- The risk of surface water flooding is assessed as negligible for most of the Site, with an area of low risk associated with surface water ponding.
- The risk of groundwater flooding is assessed as negligible above ground but low below ground.
- The risk of flooding form sewers is assessed as negligible for most of the Site but low along the reach of the foul sewer.
- The risk of flooding from all other sources is assessed as negligible.

7.3 Mitigation Measures

7.3.1 Flood risk can be mitigated to a negligible level through the following approach:

- Set finished floor levels above external levels.
- Adoption of a surface water management strategy.
- Provide a development free easement along onsite public foul water sewer assets, or re-direct around the Site boundary.
- No below surface habitable buildings (i.e., basements).

7.4 Flood Guidance

7.4.1 The proposed residential use is classified as more vulnerable. More vulnerable uses are considered acceptable in terms of flood risk in Flood Zone 1 (low risk). Given that the proposed residential uses are solely located within Flood Zone 1, the Sequential Test is not required (which is in accordance with the recent Court of Appeal judgement [Case No: CA-2023-000087, dated 17th January 2024] - Appendix 8). Other potential sources of flooding have been considered and found to be negligible so low and can be managed using the above mitigation measures.

7.5 Site Drainage

Surface Water

7.5.1 The proposed development will increase the area of impermeable surfaces and therefore increase the amount of runoff without mitigation.

7.5.2 Surface water runoff from the proposed development would be attenuated on-site, in detention basins, up to and including the 1 in 100-year event, plus 45% climate change, with

an outfall to surface water sewer. This approach offers a betterment to existing conditions with uncontrolled runoff across all return periods.

7.5.3 A SuDS drainage scheme is proposed to manage excess runoff from the development, comprising detention basins, designed to maintain runoff at pre-development rates.

Foul Water

7.5.4 It is proposed that foul flows will discharge to Halterworth Lane via a pumped solution.

7.6 Conclusion

7.6.1 This FRA demonstrates the proposed development would be operated with minimal risk from flooding, would not increase flood risk elsewhere and is compliant with the requirements of national policy and guidance.

7.6.2 The development should therefore not be precluded on the grounds of flood risk, as well as surface water and foul drainage.

NOTES

1. Do not scale from this drawing
2. All dimensions are in meters unless stated otherwise
3. This drawing is to be read in conjunction with all relevant drawings and documents associated with this project.
4. All surveyed information including levels and layout is provided by others
5. All existing and proposed dimensions, levels and locations to be checked and verified by the main contractor on site prior to the commencement of the works and any anomalies reported to the engineer.
6. All works, workmanship and materials on private drainage to be in accordance with the civil engineering specification for water industry 7th edition published by the water research council.

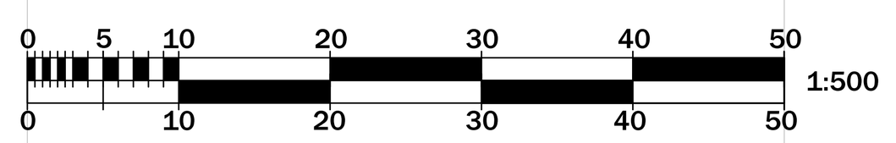
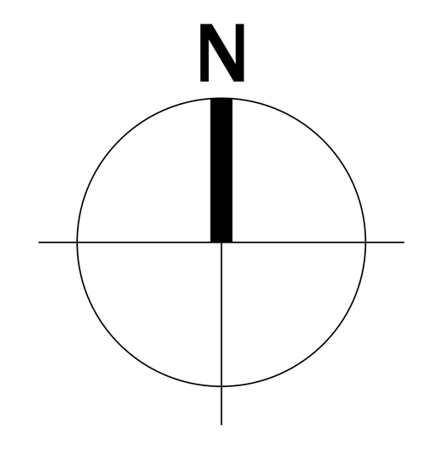
TREE DIAMETER MEASURED APPROXIMATELY 1.5M ABOVE GROUND LEVEL. TREE SPREADS ARE SYMBOLIC ONLY AND ARE REPRESENTATIVE OF THE GENERALISED CANOPY SIZE. TREE BOLE MAY NOT SIT CENTRALLY TO THE CANOPY. TREE HEIGHT ESTIMATED FROM GROUND LEVEL.





NOTES

THIS SURVEY IS ORIENTATED TO ORDNANCE SURVEY GRID NORTH. THE SURVEY IS TO A PLANE GRID. HORIZONTAL MEASUREMENTS TAKEN FROM THIS SURVEY WILL BE GROUND DISTANCES.

SITE CENTRE: E 437424, N 121309

LOCAL SCALE FACTOR: 0.9996185

ALL LEVELS RELATE TO ORDNANCE SURVEY DATUM GENERATED BY ACTIVE GPS NETWORK.

DRAINAGE:-

NO ALLOWANCE HAS BEEN MADE FOR SUB SURFACE ACCESS TO MANHOLES OR CHAMBERS. ANY PIPE SIZES, DEPTHS OR BELOW GROUND DIMENSIONS ARE TAKEN FROM THE SURFACE AND THUS WILL ONLY BE APPROXIMATE. ANY FLOW TYPES (FOUL WATER, SURFACE WATER OR COMBINED) ARE ASSUMED AND THEREFORE REQUIRE VERIFICATION.

ROAD MARKINGS:-

ROAD MARKINGS DISPLAYED ARE SYMBOLIC. LENGTH, SPACING AND THICKNESS ETC. ARE INDICATIVE ONLY.

DRAINAGE AND WATER ENQUIRY

Southern Water

What you need to know about...

Private sewer transfer

On 1 October 2011, ownership of private sewers and lateral drains changed in accordance with The Water Industry (Schemes for Adoption of Private Sewers) Regulations 2011. The contents of this search may not reflect these changes.

For further information please visit our website: www.southernwater.co.uk/sewer-ownership-changes.

Records searched

The following records were searched in compiling this report: the Map of Public Sewers, the Map of Waterworks, water and sewerage records, the Register of Properties subject to Internal Foul Flooding, the Register of Properties subject to Poor Water Pressure and the Drinking Water Register. Should the property not fall entirely within Southern Water's region, a copy of the records held by the relevant water company was searched.

Competition in the non-household retail market

From April 2017 non-household customers in England can choose their retailer. 'Retail' refers to the way in which customers are billed for their water and sewerage as well as customer services including meter reading.

The 'wholesale' part of the water industry was not opened for competition in April 2017. This means Southern Water continues to look after the pipes and infrastructure for all its customers across Kent, Sussex, Hampshire and the Isle of Wight.

Moving

There can be a lot to do and remember when you're moving. Whether you are moving within our area, moving into our area or moving out of the area please let your retailer know.

Your order summary

	Maps	
1.1	Where relevant, please include a copy of an extract from the public sewer map.	Map provided
1.2	Where relevant, please include a copy of an extract from the map of waterworks	Map provided
	Drainage	
2.1	Does foul water from the property drain to a public sewer?	No
2.2	Does surface water from the property drain to a public sewer?	No
2.3	Is a surface water drainage charge payable?	See answer
2.4	Does the public sewer map indicate any public sewer, disposal main or lateral drain within the boundaries of the property?	Yes
2.4.1	Does the public sewer map indicate any public pumping station or any other ancillary apparatus within the boundaries of the property?	No
2.5	Does the public sewer map indicate any public sewer within 30.48 metres (100 feet) of any buildings within the property?	No
2.5.1	Does the public sewer map indicate any public pumping station or any other ancillary apparatus within 50 metres of any buildings within the property?	No
2.6	Are any sewers or lateral drains serving, or which are proposed to serve the property, the subject of an existing adoption agreement or an application for such an agreement?	No
2.7	Has any sewerage undertaker approved or been consulted about any plans to erect a building or extension on the property over or in the vicinity of a public sewer, disposal main or drain?	No
2.8	Is the building which is or forms part of the property at risk of internal flooding due to overloaded public sewers?	No
2.9	Please state the distance from the property to the nearest boundary of the nearest sewage treatment works.	See answer
	Water	
3.1	Is the property connected to mains water supply?	No
3.2	Are there any water mains, resource mains or discharge pipes within the boundaries of the property?	No
3.3	Is any water main or service pipe serving, or which is proposed to serve the property, the subject of an existing adoption agreement or an application for such an agreement?	No
3.4	Is the property at risk of receiving low water pressure or flow?	No
3.5	What is the classification of the water supply for the property?	See answer
3.6	Is there a meter installed at this property?	See answer
	Charging	
4.1.1	Who is responsible for providing the sewerage services for the property?	Southern Water
4.1.2	Who is responsible for providing the water services for the property?	Southern Water
4.2	Who bills the property for sewerage services?	See answer
4.3	Who bills the property for water services?	See answer
	Trade effluent information	
4.4	Is there a consent on this property to discharge trade effluent under Section 118 of the Water Industry Act (1991) into the public sewerage system?	No

Maps

Public sewer map

Q. 1.1: Where relevant, please include a copy of an extract from the public sewer map.

A.: A copy of an extract from the public sewer map is provided.

Guidance notes:

The Water Industry Act 1991 defines public sewers as those which the Company has responsibility for. Other assets and rivers, watercourses, ponds, culverts or highway drains may be shown for information purpose only.

Any private sewers or lateral drains which are indicated on the extract of the public sewer map as being subject to an agreement under Section 104 of the Water Industry Act 1991 are not an "as constructed" record. It is recommended these details be checked with the developer.

Map of waterworks

Q. 1.2: Where relevant, please include a copy of an extract from the map of waterworks.

A.: A copy of an extract of the map of waterworks is provided.

Guidance notes:

Assets other than vested water mains may be shown on the plan for information only.

The Company is not responsible for private supply pipes connecting the property to the public water main and does not hold details of these. These may pass through land outside of the control of the seller, or may be shared with adjacent properties. The buyer may wish to investigate whether separate rights or easements are needed for their inspection, repair or renewal.

If an extract of the public water main record is enclosed, this will show known public water mains in the vicinity of the property. It should be possible to estimate the likely length and route of any private water supply pipe connecting the property to the public water network.

Drainage

Foul water

Q. 2.1: Does foul water from the property drain to a public sewer?

A.: The Company's records indicate that foul water from the property does not drain to the public sewerage system.

Guidance notes:

The Company is not responsible for private drains and sewers that connect the property to the public sewerage system and does not hold details of these.

The property owner will normally have sole responsibility for private drains serving the property and may have shared responsibility, with other users, if the property is served by a private sewer which also serves other properties. These may pass through land outside of the control of the seller and the buyer may wish to investigate whether separate rights or easements are needed for their inspection, repair or renewal.

An extract from the public sewer map is enclosed. This will show known public sewers in the vicinity of the property and it should be possible to estimate the likely length and route of any private drains and/or sewers connecting the property to the public sewerage system.

If foul water does not drain to the public sewerage system the property may have private facilities in the form of a cesspit, septic tank or other type of treatment plant.

Surface water

Q. 2.2: Does surface water from the property drain to a public sewer?

A.: The Company's records indicate that surface water from the property does not drain to the public sewerage system. If the property was constructed after 6 April 2015 the surface water drainage may be served by a Sustainable Drainage System. Further information may be available from the developer.

Guidance notes:

The Company is not responsible for private drains and sewers that connect the property to the public sewerage system and does not hold details of these.

The property owner will normally have sole responsibility for private drains serving the property and may have shared responsibility, with other users, if the property is served by a private sewer which also serves other properties. These may pass through land outside of the control of the seller and the buyer may wish to investigate whether separate rights or easements are needed for their inspection, repair or renewal.

An extract from the public sewer map is enclosed. This will show known public sewers in the vicinity of the property and it should be possible to estimate the likely length and route of any private drains and/or sewers connecting the property to the public sewerage system.

In some cases company records do not distinguish between foul and surface water connections to the public sewerage system. If on inspection the buyer finds that the property is not connected for surface water drainage, the property may be eligible for a rebate of the surface water drainage charge. Details can be obtained from the Company.

If surface water does not drain to the public sewerage system the property may have private facilities in the form of a soakaway or private connection to a watercourse

Surface water drainage charge

Q. 2.3: Is a surface water drainage charge payable?

A.: Records confirm that a surface water drainage charge is not applicable at this property. If the property was constructed after 6 April 2015 the surface water drainage may be served by a Sustainable Drainage System. Further information may be available from the developer.

Guidance notes:

Where surface water from a property does not drain to the public sewerage system no surface water drainage charges are applicable.

If on inspection the buyer finds that the property is not connected for surface water drainage, the buyer should contact their retailer.

Public sewers within the boundary of the property

Q. 2.4: Does the public sewer map indicate any public sewer, disposal main or lateral drain within the boundaries of the property?

A.: The public sewer map included indicates that there is a public sewer, disposal main or lateral drain within the boundaries of the property. However, from 1 October 2011 there may be additional public sewers, disposal mains or lateral drains which are not recorded on the public sewer map but which may further prevent or restrict development of the property.

Guidance notes:

The approximate boundary of the property has been determined by reference to the Ordnance Survey record or the map supplied.

The presence of a public sewer within the boundary of the property may restrict further development within it.

Southern Water Services has a statutory right of access to carry out work on their assets, subject to notice. This may result in employees of Southern Water Services or its contractors needing to enter the property to carry out work.

Please note if the property was constructed after 1 July 2011 any sewers and/or lateral drain within the boundary of the property are the responsibility of the householder.

Public pumping station within the boundary of the property

Q. 2.4.1: Does the public sewer map indicate any public pumping station or any other ancillary apparatus within the boundaries of the property?

A.: The public sewer map included indicates that there is no public pumping station within the boundaries of the property. Any other ancillary apparatus is shown on the public sewer map and referenced on the legend.

Guidance notes:

The approximate boundary of the property has been determined by reference to the Ordnance Survey record or the map supplied.

The presence of a pumping station within the boundary of the property may restrict further development within it.

Southern Water Services has a statutory right of access to carry out work on their assets, subject to notice. This may result in employees of Southern Water Services or its contractors needing to enter the property to carry out work.

It should be noted that only private pumping stations installed before 1 July 2011 will be transferred into the ownership of Southern Water Services.

Public sewers near to the property

Q. 2.5: Does the public sewer map indicate any public sewer within 30.48 metres (100 feet) of any buildings within the property?

A.: The public sewer map indicates that there are no public sewers within 30.48 metres (100 feet) of a building within the property.

Guidance notes:

From 1 October 2011 there may be additional lateral drains and/or public sewers which are not recorded on the public sewer map but are also within 30.48 metres (100 feet) of a building within the property.

The presence of a public sewer within 30.48 metres (100 feet) of a building within the property can result in the local authority requiring a property to be connected to the public sewer.

The measure is estimated from the Ordnance Survey record, between a building within the boundary of the property and the nearest public sewer.

Public pumping station near to the property

Q. 2.5.1: Does the public sewer map indicate any public pumping station or any other ancillary apparatus within 50 metres of any buildings within the property?

A.: The public sewer map included indicates that there is no public pumping station within 50 metres of any buildings within the property. Any other ancillary apparatus is shown on the public sewer map and referenced on the legend.

Guidance notes:

The measure is estimated from the Ordnance Survey record, between a building within the boundary of the property and the nearest pumping station.

It should be noted that only private pumping stations installed before 1 July 2011 will be transferred into the ownership of Southern Water Services.

Public adoption of sewers and lateral drains

Q. 2.6: Are any sewers or lateral drains serving, or which are proposed to serve the property, the subject of an existing adoption agreement or an application for such an agreement?

A.: Records indicate that the sewers serving the development, of which this property forms part, are not the subject of an application for adoption under Section 104 of the Water Industry Act 1991. Where the property is part of an established development it would not normally be subject to an adoption agreement under Section 104 of the Water Industry Act 1991.

Guidance notes:

This enquiry is of interest to purchasers of new buildings who will want to know whether or not the building will be linked to a public sewer.

Where the property is part of a very recent or ongoing development and the sewers are not the subject of an adoption application, buyers should consult with the developer to ascertain the extent of private drains and sewers for which they will hold maintenance and renewal liabilities.

Final adoption is subject to the developer complying with the terms of the adoption agreement under Section 104 of the Water Industry Act 1991.

Any sewers and/or lateral drains within the boundary of the property are not the subject of an adoption agreement and remain the responsibility of the householder. Adoptable sewers are normally those situated in the public highway.

Building over a public sewer, disposal main or drain

Q. 2.7: Has the sewerage undertaker approved or been consulted about any plans to erect a building or extension on the property over or in the vicinity of a public sewer, disposal main or drain?

A.: There are no records in relation to any approval or consultation about any plans to erect a building or extension on the property over or in the vicinity of a public sewer, disposal main or drain. However, the sewerage undertaker might not be aware of a building or extension on the property over or in the vicinity of a public sewer, disposal main or drain.

Guidance notes:

Buildings or extensions erected over a sewer in contravention of Building Control may have to be removed or altered.

From 1 October 2011 private sewers, disposal mains and lateral drains were transferred into public ownership and the sewerage undertaker may not have approved or been consulted about any plans to erect a building or extension on the property or in the vicinity of these.

Risk of flooding due to overloading public sewers

Q. 2.8: Is the building which is or forms part of the property at risk of internal flooding due to overloaded public sewers?

A.: The building is not recorded as being at risk of internal flooding due to overloaded public sewers. From 1 October 2011 private sewers, disposal mains and lateral drains were transferred into public ownership. It is therefore possible that a building may be at risk of internal flooding due to an overloaded public sewer which the sewerage undertaker is not aware of. For further information it is recommended that enquiries are made of the vendor.

Guidance notes:

A sewer is "overloaded" when the flow from a storm is unable to pass through it due to a permanent problem (e.g. flat gradient, small diameter). Flooding as a result of temporary problems such as blockages, siltation, collapses and equipment or operational failures are excluded.

"Internal flooding" from the public sewers is defined as flooding, which enters a building or passes below a suspended floor.

For reporting purposes, buildings are restricted to those normally occupied and used for residential, public, commercial, business or industrial purposes

"At Risk" properties are defined as properties that have suffered or are likely to suffer internal flooding from the public foul, combined or surface water sewers due to overloading of the sewerage system more frequently than the relevant reference period (either once or twice in ten years) as determined by the sewerage undertaker's reporting procedure.

Flooding as a result of storm events proven to be exceptional and beyond the reference period of one in ten years are not included.

Buildings may be at risk of flooding but not identified where flooding incidents have not been reported to the sewerage undertaker.

Public sewers are defined as those for which the sewerage undertaker holds statutory responsibility under the Water Industry Act 1991.

It should be noted that flooding can occur from private sewers and drains which are not the responsibility of the sewerage undertaker. This report excludes flooding from the private sewers and drains and the sewerage undertaker makes no comment upon this matter.

Sewage treatment works

Q. 2.9: Please state the distance from the property to the nearest boundary of the nearest sewage treatment works.

A.: The nearest sewage treatment works is 3.09 kilometres West of the property. The name of the sewage treatment works is ROMSEY WTW, which is the responsibility of Southern Water Services, Southern House, Yeoman Road, Worthing, West Sussex, BN13 3NX.

Guidance notes:

The nearest sewage treatment works will not always be the sewage treatment works serving the catchment within which the property is situated.

The sewerage undertaker's records were inspected to determine the nearest sewage treatment works

It should be noted that there may be a private sewage treatment works closer than the one detailed above that have not been identified.

Water

Connection to mains water supply

Q. 3.1: Is the property connected to mains water supply?

A.: Records indicate that the property is not connected to mains water supply and water is therefore likely to be provided by virtue of a private supply.

Guidance notes:

The situation should be checked with the current owner of the property.

Details of private supplies are not kept by the water undertaker.

Water mains, resource mains or discharge pipes

Q. 3.2: Are there any water mains, resource mains or discharge pipes within the boundaries of the property?

A.: The map of the waterworks does not indicate any water mains, resource mains or discharge pipes within the boundaries of the property.

Guidance notes:

The boundary of the property has been determined by reference to the Ordnance Survey record or the map supplied.

The presence of a public water main within the boundary of the property may restrict further development within it.

Water undertakers have a statutory right of access to carry out work on their assets, subject to notice. This may result in employees of the water undertaker or its contractors needing to enter the property to carry out work.

Adoption of water mains and services pipes

Q. 3.3: Is any water main or service pipe serving, or which is proposed to serve the property, the subject of an existing adoption agreement or an application for such an agreement?

A.: Records confirm that water mains or service pipes serving the property are not the subject of an existing adoption agreement or an application for such an agreement.

Guidance notes:

This enquiry is of interest to purchasers of new properties who will want to know whether or not the property will be linked to the mains water supply.

Risk of low water pressure or flow

Q. 3.4: Is the property at risk of receiving low water pressure or flow?

A.: Records confirm that the property is not recorded by the water undertaker as being at risk of receiving low water pressure or flow.

Guidance notes:

"Low water pressure" means water pressure below the regulatory reference level which is the minimum pressure when demand on the system is not abnormal.

The reference level of service is a flow of 9 litres/minute at a pressure of 10 metres head on the customer's side of the main stop tap (mst). The reference level of service must be applied on the customer's side of a meter or any other company fittings that are on the customer's side of the main stop tap.

The reference level applies to a single property. Where more than one property is served by a common service pipe, the flow assumed in the reference level must be appropriately increased to take account of the total number of properties served.

For two properties, a flow of 18 litres/minute at a pressure of 10 metres head on the customers' side of the mst is appropriate. For three or more properties the appropriate flow should be calculated from the standard loadings provided in BS6700 or Institute of Plumbing handbook.

Water companies include properties receiving pressure below the reference level, provided that allowable exclusions do not apply (i.e. events which can cause pressure to temporarily fall below the reference level). Refer to list below:

Abnormal demand: This exclusion is intended to cover abnormal peaks in demand and not the daily, weekly or monthly peaks in demand which are normally expected. Companies exclude properties which are affected by low pressure only on those days with the highest peak demands. During the year companies may exclude, for each property, up to five days of low pressure caused by peak demand.

Planned maintenance: Companies exclude low pressures caused by planned maintenance. It is not intended that companies identify the number of properties affected in each instance. However, companies must maintain sufficiently accurate records to verify that low pressure incidents that are excluded because of planned maintenance are actually caused by maintenance.

One-off incidents: This exclusion covers a number of causes of low pressure; mains bursts; failures of company equipment (such as PRVs or booster pumps); firefighting; and action by a third party. However, if problems of this type affect a property frequently, they cannot be classed as one-off events and further investigation will be required before they can be excluded.

Low pressure incidents of short duration: Properties affected by low pressures which only occur for a short period, and for which there is evidence that incidents of a longer duration would not occur during the course of the year, may be excluded.

Water hardness

Q. 3.5: What is the classification of the water supply for the property?

A.: The water supplied to the property has an average water hardness of 281mg/l calcium carbonate which is defined as "Hard" by Southern Water.

Guidance notes:

The hardness of water depends on the amount of calcium in it – the more it contains, the harder the water is.

There is no UK or European standard set for the hardness of drinking water. More information on water hardness can be found on the Drinking Water Inspectorates' website: http://www.dwi.gov.uk/

Water hardness can be expressed in various indices for example the hardness settings for dishwashers are commonly expressed in Clark's degrees, but check with the manufacturer as there are also other units. The following table explains how to convert mg/l calcium and mg/l calcium carbonate classifications.

To convert from:	to Clark degrees	to French degrees	to German degrees
mg/l calcium	multiply by 0.18	multiply by 0.25	multiply by 0.14
mg/l calcium carbonate	multiply by 0.07	multiply by 0.10	multiply by 0.056

Water meters

Q. 3.6: Is there a meter installed at this property?

A.: Records indicate that the property is not served by a water meter

Guidance notes:

Where the property is not served by a water meter and the customer wishes to consider this method of charging they should contact the water undertaker for their area.

If a property is measured (metered) upon change of occupation this property will remain as a metered property.

Charging

Sewerage undertaker

Q. 4.1.1: Who is responsible for providing the sewerage services for the property?

A.: Southern Water is responsible for providing the sewerage services for the property.

Guidance notes:

The 'wholesale' part of the water industry did not open for competition in April 2017. This means that Southern Water continues to operate the network of pipes, mains and treatment works.

As a wholesaler, Southern Water sells sewerage services to the companies who enter the retail market. In some instances, wholesalers will still need to interact directly with customers. For example, customers will still contact Southern Water to report internal sewer flooding.

Water undertakers

Q. 4.1.2: Who is responsible for providing the water services for the property?

A.: Southern Water is responsible for providing the water services for the property.

Guidance notes:

The 'wholesale' part of the water industry did not open for competition in April 2017. This means that water undertakers continue to operate the network of pipes, mains and treatment works.

As a wholesaler, water undertakers sell water services to the companies who enter the retail market. In some instances, wholesalers will still need to interact directly with customers. For example, customers will still contact water undertakers to report leaks.

Sewerage bills

Q. 4.2: Who bills the property for sewerage services?

A.: If you wish to know who bills the sewerage services for this property then you will need to contact the current owner. For a list of all potential retailers of sewerage services for the property please visit www.open-water.org.uk.

Guidance notes:

From April 2017 non-household customers in England can choose their retailer.

'Retail' refers to the way in which customers are billed for their water and sewerage as well as customer services including meter reading.

Water bills

Q. 4.3: Who bills the property for water services?

A.: If you wish to know who bills the water services for this property then you will need to contact the current owner. For a list of all potential retailers of water services for the property please visit www.open-water.org.uk.

Guidance notes:

From April 2017 non-household customers in England can choose their retailer.

'Retail' refers to the way in which customers are billed for their water and sewerage as well as customer services including meter reading

Trade effluent information

Q. 4.4: Is there a consent on this property to discharge trade effluent under Section 118 of the Water Industry Act (1991) into the public sewerage system?

A.: The trader operating at this commercial property does not hold either a Trade Effluent Consent, or an acknowledgement of a trade effluent discharge, as issued by Southern Water.

Guidance notes:

Please note, any existing consent is dependent on the business being carried out at the property and will not transfer automatically upon change of ownership.

Any change of ownership from the current incumbent of a property will require the negotiation of a new trade effluent consent or a new acknowledgement between the new incumbent and Southern Water.

Where consent or acknowledgement details have been provided, this does not represent a direct copy of the original.

Other information

Additional meter information
No further information.

Appendix one: Terms and expressions

"the 1991 Act" means the Water Industry Act 1991**(i)**;
"the 2000 Regulations" means the Water Supply (Water Quality) Regulations 2000**(ii)**;
"the 2001 Regulations" means the Water Supply (Water Quality) Regulations 2001**(iii)**;
"adoption agreement" means an agreement made or to be made under Section 51A(1) or 104(1) of the 1991 Act**(iv)**;
"bond" means a surety granted by a developer who is a party to an adoption agreement;
"bond waiver" means an agreement with a developer for the provision of a form of financial security as a substitute for a bond;
"calendar year" means the twelve months ending with 31 December;
"discharge pipe" means a pipe from which discharges are made or are to be made under Section 165(1) of the 1991 Act;
"disposal main" means (subject to Section 219(2) of the 1991 Act) any outfall pipe or other pipe which:
(a) is a pipe for the conveyance of effluent to or from any sewage disposal works, whether of a sewerage undertaker or of any other person; and
(b) is not a public sewer;
"drain" means (subject to Section 219(2) of the 1991 Act) a drain used for the drainage of one building or any buildings or yards appurtenant to buildings within the same curtilage;
"effluent" means any liquid, including particles of matter and other substances in suspension in the liquid;
"financial year" means the twelve months ending with 31 March;
"lateral drain" means:
(a) that part of a drain which runs from the curtilage of a building (or buildings or yards within the same curtilage) to the sewer with which the drain communicates or is to communicate; or
(b) (if different and the context so requires) the part of a drain identified in a declaration of vesting made under Section 102 of the 1991 Act or in an agreement made under Section 104 of that Act**(v)**;
"licensed water supplier" means a company which is the holder for the time being of a water supply licence under Section 17A(1) of the 1991 Act**(vi)**;
"maintenance period" means the period so specified in an adoption agreement as a period of time:
(a) from the date of issue of a certificate by a sewerage undertaker to the effect that a developer has built (or substantially built) a private sewer or lateral drain to that undertaker's satisfaction; and
(b) until the date that private sewer or lateral drain is vested in the sewerage undertaker;
"map of waterworks" means the map made available under section 198(3) of the 1991 Act**(vii)** in relation to the information specified in subsection (1A);
"private sewer" means a pipe or pipes which drain foul or surface water, or both, from premises, and are not vested in a sewerage undertaker;
"public sewer" means, subject to Section 106(1A) of the 1991 Act**(viii)**, a sewer for the time being vested in a sewerage undertaker in its capacity as such, whether vested in that undertaker:
(a) by virtue of a scheme under Schedule 2 to the Water Act 1989**(ix)**;
(b) by virtue of a scheme under Schedule 2 to the 1991 Act**(x)**;
(c) under Section 179 of the 1991 Act**(xi)**; or
(d) otherwise;
"public sewer map" means the map made available under Section 199(5) of the 1991 Act**(xii)**;
"resource main" means (subject to Section 219(2) of the 1991 Act) any pipe, not being a trunk main, which is or is to be used for the purpose of:
(a) conveying water from one source of supply to another, from a source of supply to a regulating reservoir or from a regulating reservoir to a source of supply; or
(b) giving or taking a supply of water in bulk;
"sewerage services" includes the collection and disposal of foul and surface water and any other services which are required to be provided by a sewerage undertaker for the purpose of carrying out its functions;
"Sewerage undertaker" means the company appointed to be the sewerage undertaker under Section 6(1) of the 1991 Act for the area in which the property is or will be situated;
"surface water" includes water from roofs and other impermeable surfaces within the curtilage of the property;
"water main" means (subject to Section 219(2) of the 1991 Act) any pipe, not being a pipe for the time being vested in a person other than the water undertaker, which is used or to be used by a water undertaker or licensed water supplier for the purpose of making a general supply of water available to customers or potential customers of the undertaker or supplier, as distinct from for the purpose of providing a supply to particular customers;
"water meter" means any apparatus for measuring or showing the volume of water supplied to, or of effluent discharged from any premises;
"water supplier" means the company supplying water in the water supply zone, whether a water undertaker or licensed water supplier;
"water supply zone" means the names and areas designated by a water undertaker within its area of supply that are to be its water supply zones for that year; and
"Water undertaker" means the company appointed to be the water undertaker under Section 6(1) of the 1991 Act for the area in which the property is or will be situated.

In this report, references to a pipe, including references to a main, a drain or a sewer, shall include references to a tunnel or conduit which serves or is to serve as the pipe in question and to any accessories for the pipe.

(i) 1991 c.56.
(ii) S.I. 2000/3184. These Regulations apply in relation to England.
(iii) S.I. 2001/3911. These Regulations apply in relation to Wales.
(iv) Section 51A was inserted by Section 92(2) of the Water Act 2003 (c. 37). Section 104(1) was amended by Section 96(4) of that Act.
(v) Various amendments have been made to Sections 102 and 104 by section 96 of the Water Act 2003.
(vi) Inserted by Section 56 of and Schedule 4 to the Water Act 2003.
(vii) Subsection (1A) was inserted by Section 92(5) of the Water Act 2003.
(viii) Section 106(1A) was inserted by Section 99 of the Water Act 2003.
(ix) 1989 c.15.
(x) To which there are various amendments made by Section 101(1) of and Schedule 8 to the Water Act 2003.
(xi) To which there are various amendments made by Section 101(1) of and Schedule 8 to the Water Act 2003.
(xii) Section 199 was amended by Section 97(1) and (8) of the Water Act 2003.

Appendix two: A guide to new development

The information contained below is for general guidance only. It is recommended that Southern Water's Developer Services department be contacted for further details concerning new infrastructure development.

Wastewater information

Sewer requisitions

It may be necessary for a developer to request that Southern Water provides a public sewer to connect a development site to the existing public system. The developer is responsible for the cost of the work, although a discount will be applied based on the future predicted income from the development served by the new sewer.

Sewer diversions

If a public sewer crosses private land, it may be possible for the landowner/developer to request the sewer be diverted. In the majority of cases Southern Water will allow the developer to undertake this work under close supervision. Whether Southern Water or the developer undertakes the diversionary works the costs are the responsibility of the developer.

Building-over sewers

Public sewers are afforded statutory protection and consequently there is no right to build over or in close proximity to a public sewer. If an existing public sewer either crosses a development site or is located in close proximity to a development site it is essential that a developer contact Southern Water.

Sewer connections

A developer can serve notice on Southern Water that it wishes to make a connection to the public sewerage system. The developer must provide 21 days' notice and the work will be supervised by Southern Water.

Water information

Water requisitions

It may be necessary for a developer to request that Southern Water provides both:

(a) A public water main to connect a development site to the existing public system and,
(b) On-site public water mains to serve the individual properties.

In both cases the developer is responsible for the cost of the work, although a discount will be applied based on the future predicted income from the development.

It is possible for the developer to lay the on-site mains themselves under a Self-Lay Agreement. Further details are available from Southern Water.

Water main diversions

The building over or in close proximity to public water mains is not permitted. A developer must request that Southern Water undertakes a diversion of a water main that is affected by a development.

Water connections

A developer can request a new connection to a public water main. This work will be undertaken by Southern Water.

Contact us

For specific information on Southern Water's Developer Services service, including details on how to contact the right person, please visit our website: www.southernwater.co.uk/developers-and-builders-overview.

Appendix three: Terms and conditions

The Customer the Client and the Purchaser are asked to note these terms, which govern the basis on which this drainage and water report is supplied.

Definitions
"The Company" means the water service company operating within the Southern Water drainage area that provides information to Southern Water for this commercial search Report.
"Order" means any request completed by the Customer requesting the Report.
"Report" means the drainage and/or water report prepared by The Company in respect of the Property.
"Property" means the address or location supplied by the Customer in the Order.
"Customer" means the person, company, firm or other legal body placing the Order, either on their own behalf as Client, or, as an agent for a Client.
"Client" means the person, company or body who is the intended recipient of the Report with an actual or potential interest in the Property.
"Purchaser" means the actual or potential purchaser of the Property including their mortgage lender.

1.0 Agreement
1.1 Southern Water agrees to supply the Report subject to these terms. The scope and limitations of the Report are described in paragraph 2 of these terms. Where the Customer is acting as an agent for the Client then the Customer shall be responsible for bringing these terms to the attention of the Client.
1.2 The Customer and Client agree that the placing of an Order for a Report indicates their acceptance of these terms.

2.0 The Report
Whilst Southern Water will use reasonable care and skill in producing the Report, it is provided to the Client on the basis that they acknowledge and agree to the following:
2.1 The information contained in the Report can change on a regular basis so Southern Water cannot be responsible to the Client for any change in the information contained in the Report after the date on which the Report was produced and sent to the Client.
2.2 The Report does not give details about the actual state or condition of the Property nor should it be used or taken to indicate or exclude actual suitability or unsuitability of the Property for any particular purpose, or relied upon for determining saleability or value, or used as a substitute for any physical investigation or inspection. Further advice and information from appropriate experts and professionals should always be obtained.
2.3 The information contained in the Report is based upon the accuracy of the address supplied by the Customer or Client.
2.4 The Report provides information as to the location and connection of existing services, and details of trade effluent consents. It should not be relied upon for any other purpose. The Report may contain opinions or general advice to the Customer and the Client and Southern Water cannot ensure that any such opinion or general advice is accurate, complete or valid and accepts no liability therefore.
2.5 The position and depth of apparatus shown on any maps attached to the Report are approximate, and are furnished as a general guide only, and no warranty as to its correctness is given or implied. The exact positions and depths should be obtained by excavation trial holes.

3.0 Liability
3.1 Southern Water shall not be liable to the Client for any failure defect or non-performance of its obligations arising from any failure of or defect in any machine, processing system or transmission link or anything beyond Southern Water's reasonable control or the acts or omissions or any party for whom Southern Water is not responsible.
3.2 Where a Report is requested for an address falling within a geographical area where Southern Water and another Company separately provide water and sewerage services, then it shall be deemed that liability for the information given by Southern Water or the Company as the case may be will remain with Southern Water or the Company as the case may be in respect of the accuracy of the information supplied. Where Southern Water is supplying information which has been provided to it by another Company for the purposes outlined in this agreement, Southern Water will therefore not be liable in any way for the accuracy of that information.
3.3 Where the Customer sells this Report to a Client (other than in the case of a bona fide legal adviser recharging the cost of the Report as a disbursement) Southern Water or the Company as the case may be shall not in any circumstances (whether for breach of contract, negligence or any other tort, under statute or statutory duty or otherwise at all) be liable for any loss or damage whatsoever (save to the extent provided by clause 3.4) and the Customer shall indemnify Southern Water in respect of any claim (other than a claim covered by clause 3.4) by the Client.
3.4 Southern Water shall accept liability for death or personal injury arising from its negligence.
3.5 The entire liability of Southern Water or the Company as the case may be in respect of all causes of action arising under or in connection with the Report (whether for breach of contract, negligence or any other tort, under statute or statutory duty or otherwise at all) shall not exceed £2,000,000 (two million pounds); and Southern Water or the Company as the case may be shall not in any circumstances (whether for breach of contract, negligence or any other tort, under statute or statutory duty or otherwise at all) be liable for any loss of profit, loss of goodwill, loss of reputation, loss of business or any indirect, special or consequential loss, damage or other claims, costs or expenses.

4.0 Copyright and confidentiality
4.1 The Customer and the Client acknowledge that the Report is confidential and is intended for the personal use of the Client. The copyright and any other intellectual property rights in the Report shall remain the property of Southern Water. No intellectual or other property rights are transferred or licensed to the Customer or the Client except to the extent expressly provided.
4.2 The Customer or Client is entitled to make copies of the Report (other than any maps contained in the, or attached to the Report, where no copying is permitted).
4.3 The Customer and Client agree (in respect of both the original and any copies made) to respect and not to alter any trademark, copyright notice or other property marking which appears on the Report.
4.4 The maps contained in the Report are protected by Crown Copyright and must not be used for any purpose outside the context of the Report.
4.5 The Customer and the Client agree to indemnify Southern Water or the Company as the case may be against any losses, costs, claims and damage suffered by Southern Water or the Company as the case may be, as a result of any breach by either of them of the terms of paragraphs 4.1 to 4.4 inclusive.

5.0 Payment
5.1 Unless otherwise stated all prices are inclusive of VAT. The Customer shall pay for the price of the Report specified by Southern Water, without any set off, deduction or counterclaim. Unless the Customer or Client has an account with Southern Water for payment for Reports, payments for Reports must be received in full by Southern Water before the Report is produced. For Customers or Clients with accounts, payment terms will be as agreed with Southern Water.

6.0 General
6.1 If any provision of these terms is or becomes invalid or unenforceable, it will be taken to be removed from the rest of these terms to the extent that it is invalid or unenforceable. No other provision of these terms shall be affected.
6.2 These terms shall be governed by English law and all parties submit to the exclusive jurisdiction of the English courts.
6.3 Nothing in this notice shall in any way restrict your statutory or any other rights of access to the information contained in the Report.

These Terms and conditions are available in larger print for those with impaired vision.

Appendix four: Complaints procedure

When we get it wrong
You deserve the highest standard of service from us, but sometimes we make mistakes. If we do, please let us know and we will investigate and review your concerns.

Whilst we always try to resolve all complaints straight away, if this is not possible and you are not happy with the course of action taken by us, you can ask us to escalate the issue internally or take your complaint to an independent third party.

How you contact us
Firstly please call us and we will try to sort out your problem straight away.

You can call us between 8am and 5pm, Monday to Friday on 0845 270 0212 or 0330 303 0276 (individual consumers);

Email us at searches@southernwater.co.uk; or

Write to us at LandSearch, Southern Water Services, Southern House, Capstone Road, Chatham, Kent, ME5 7QA.

What you can expect
You will receive a full, fair and courteous response from someone who can effectively deal with your problem.

If we can remedy the problem straight away we will do it but if we cannot immediately resolve your problem we will keep you informed of actions being taken.

The process
We will try to resolve any telephone contact or complaint at the time of the call, however, if that isn't possible, we will take the details of your complaint and we will investigate and get back to you within 10 working days.

We will respond to written complaints within 10 working days of the date received, but we will always aim to respond more quickly. Depending on the scale of investigation required, we will keep you informed of the progress and update you with new timescales if necessary.

If you are still not satisfied with our response or action we will refer the matter to a Senior Manager for resolution. At your request we will liaise with a third party representative acting on your behalf.

Our commitment to you
If we do not respond to your complaint within 10 working days of receipt of your contact, we will compensate you in line with Southern Water's Customer services — Guaranteed standards of service for business customers.

If we find your complaint to be justified, or we have made any errors that substantially change the outcome in your search result, we will refund the search fee. We will also provide you with a revised search and undertake the necessary action to put things right as soon as practically possible. You will be kept informed of the progress of any action required.

If you remain dissatisfied
While we aim to resolve your complaint first time, in the event that we are unable to resolve the issue to your satisfaction, ultimately you can contact a third party. Please make sure that you have followed the process above first, if not, your complaint will be passed back to us.

Dear Ms Lister,

Level 1 Capacity Check Enquiry: Land east of Halterworth Lane, Romsey, Hampshire, SO51 9AE.

We have completed the capacity check for the above development site and the results are as follows:

Foul Water

There is currently adequate capacity in the local sewerage network to accommodate a foul flow of **3.44 l/s** for the above development at manhole reference SU3721**2503**. Please note that no surface water flows (existing or proposed) can be accommodated within the existing foul sewerage system unless agreed by the Lead Local Flood Authority in consultation with Southern Water, after the hierarchy Part H3 of Building Regulations has been complied with.

There is currently inadequate capacity in the local sewerage network to accommodate a foul flow of **3.44 l/s** for the above development at manhole reference SU3721**2101** or SU3720**4901.**

Connecting to our network

It should be noted that this information is only a hydraulic assessment of the existing sewerage network and does not grant approval for a connection to the public sewerage system. A formal Sewer Connection (S106) application is required to be completed and approved by Southern Water Services. To make an application visit: developerservices.southernwater.co.uk

Please note the information provided above does not grant approval for any designs/drawings submitted for the capacity analysis. The results quoted above are only valid for 12 months from the date of issue of this letter.

Should it be necessary to contact us please quote our above reference number relating to this application by email at southernwaterplanning@southernwater.co.uk

Yours sincerely,

Future Growth Planning Team

Dear Mr Lister,

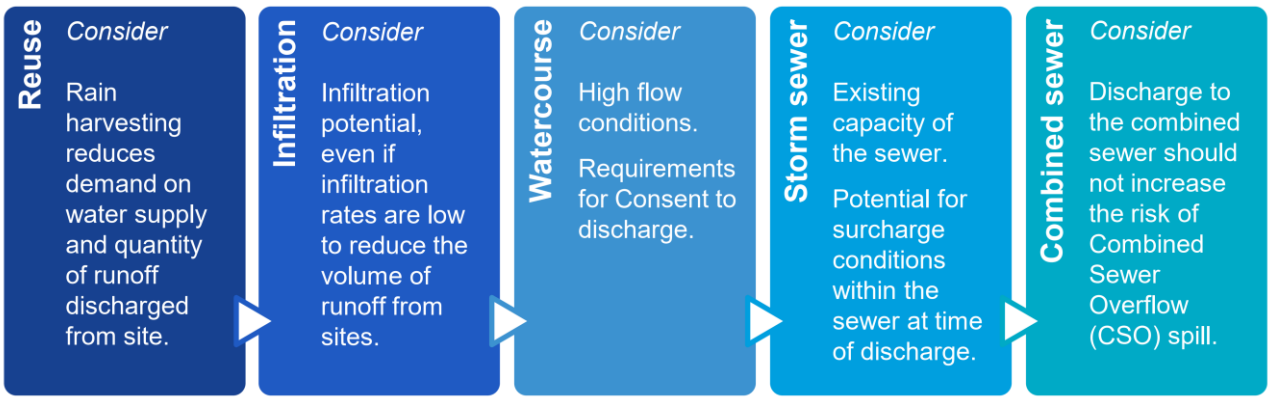
Level 1 Capacity Check Enquiry: Land east of Halterworth Lane, Romsey, Hampshire, SO51 9AE.

We have completed the capacity check for the above development site and the results are as follows:

Surface Water

There is currently adequate capacity in the local surface water sewerage network to accommodate a surface water flow of **21.91 l/s** for the above development at manhole reference SU3721**3753 (12.05 l/s),** SU3721**2655 (12.05 l/s)** and SU3721**2251 (9.86 l/s)**.

Although capacity in the surface water network has been identified, in all situations where surface water is being considered for discharge to our network, we require the below hierarchy for surface water to be followed which is reflected in part H3 of the Building Regulations. Whilst reuse does not strictly form part of this hierarchy, Southern Water would encourage the consideration of reuse for new developments.



Guidance on Building Regulations is here: gov.uk/government/publications/drainage-and-waste-disposal-approved-document-h

We would welcome the opportunity to engage with you on the design for disposal of surface water, with a particular focus on the potential for incorporating Sustainable Drainage Systems (SuDS), for this development at the earliest opportunity and we recommend that civil engineers and landscape architects work together and with Southern Water.

Where a surface water connection to the foul or combined sewer is being considered, this should be agreed by the Lead Local Flood Authority, in consultation with Southern Water.

It should be noted that although the above assessment indicates that there is capacity available for your proposed surface water flows the LLFA (Local Lead Flood Authority) may impose/request that a lower flow is discharged to the public surface water sewer.

If the excess surface water flows are to be attenuated on site, it could have a significant effect on any proposed Sewer Adoption (S104) Agreements. Any attenuation proposals should be agreed before any works are implemented on site. Where capacity is limited/restricted, agreement should be sought if you are to include any highway drainage within your proposals as Southern Water is not obligated to accept highway flows.

Connecting to our network

It should be noted that this information is only a hydraulic assessment of the existing sewerage network and does not grant approval for a connection to the public sewerage system. A formal Sewer Connection (S106) application is required to be completed and approved by Southern Water Services. To make an application visit: developerservices.southernwater.co.uk

Please note the information provided above does not grant approval for any designs/drawings submitted for the capacity analysis. The results quoted above are only valid for 12 months from the date of issue of this letter.

Please get in touch via the Get Connected customer dashboard if you have any queries.

Yours sincerely,

Future Growth Planning Team

Subject: Flood Risk Assessment Data for Halterworth Lane - Ref: SSD/328630
Attachments: FRA Info 328630.pdf

Dear Dani,

Please find attached the flood risk assessment information (previously Product 4) attached for your site off Halterworth Lane, Romsey as requested.

Product 5, 6 and 7 – Please use the link below to download the model reports (Product 5), model output data (product 6) and model input data (Product 7):

https://ea.sharefile.com/d-s2aaad9b4b0d34de294bc936a7c44d007

Name	Product 5
Description	Romsey Model Reports
Licence	Environment Agency Conditional Licence
Conditions	1.0 You may use the Information for your internal or personal purposes and may only sublicense others to use it if you do so under a written licence which includes the terms of these conditions and the agreement and in particular may not allow any period of use longer than the period licensed to you. 2.0 Notwithstanding the fact that the standard wording of the Environment Agency Conditional Licence indicates that it is perpetual, this Licence has a limited duration of 5 years at the end of which it will terminate automatically without notice. 3.0 We have restricted use of the Information as a result of legal restrictions placed upon us to protect the rights or confidentialities of others. In this instance it is because of third party data. If you contact us in writing (this includes email) we will, as far as confidentiality rules allow, provide you with details including, if available, how you might seek permission from a third party to extend your use rights. 4.1 The Information may contain some data that we believe is within the definition of "personal data" under the Data Protection Act 1998 but we consider that we will not be in breach of the Act if we disclose it to you with conditions set out in this condition and the conditions above. This personal data comprises names of individuals or commentary relating to property that may be owned by an individual or commentary relating to the activities of an individual. 4.2 Under the Act a person who holds and uses or passes to others personal data is responsible for any compliance with the Act and so we have no option but to warn you that this means you have responsibility to check that you are compliant with the Act in respect of this personal data.

	5.0 The location of public water supply abstraction sources must not be published to a resolution more detailed than 1km2. Information about the operation of flood assets should not be published. 6.1 Where we have supplied model data which may include model inputs or outputs you agree to supply to the Environment Agency copies of any assessments/studies and related outputs, modifications or derivatives created pursuant to the supply to you of the Information, all of which are hereinafter referred to as "the Data". 6.2 You agree, in the public interest to grant to the Environment Agency a perpetual royalty free non-exclusive licence to use the Data or any part thereof for its internal purposes or to use it in any way as part of Environment Agency derivative products which it supplies free of charge to others such as incorporation into the Environment Agency's Open Data mapping products.
Information Warnings	If we have provided climate change data, it is based on UKCP09 which has now been superseded by UKCP18. We have scheduled updates to our flood models to incorporate UKCP18 data, but until this is complete the majority of our models will not provide appropriate climate change data for use within Flood Risk Assessments. The correct allowances will need to be calculated using the following data: https://www.gov.uk/guidance/flood-risk-assessments-climate-change-allowances Failure to use the correct climate change data may result in us objecting to planning applications upon which we are consulted by Local Planning Authorities.
Attribution	Contains Environment Agency information © Environment Agency and/or database rights. May contain Ordnance Survey data © Crown copyright 2017 Ordnance Survey 100024198.

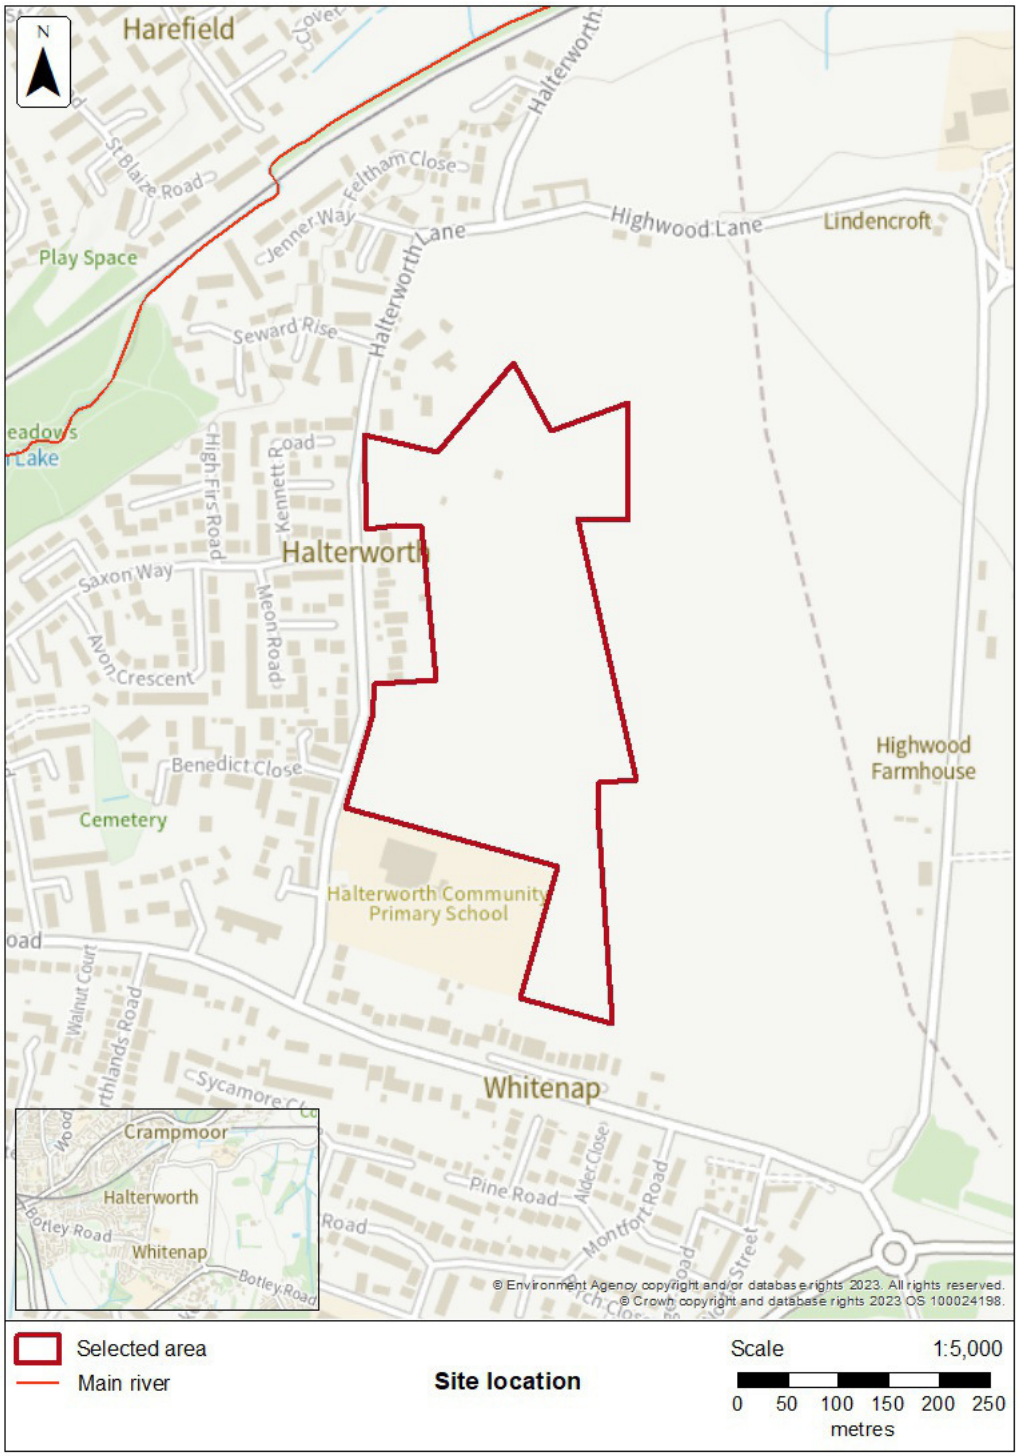
Flood risk assessment data

Location of site: 437428 / 121327 (shown as easting and northing coordinates)
Document created on: 11 October 2023
This information was previously known as a product 4.
Customer reference number: SSD 2 0

Map showing the location that flood risk assessment data has been requested for.



How to use this information

You can use this information as part of a flood risk assessment for a planning application. To do this, you should include it in the appendix of your flood risk assessment.

> **We recommend that you work with a flood risk consultant to get your flood risk assessment.**

Included in this document

In this document you'll find:

- how to find information about surface water and other sources of flooding
- definitions for the terminology used throughout
- flood map for planning (rivers and the sea)
- flood defences and attributes
- information to help you assess if there is a reduced flood risk from rivers and the sea because of defences
- modelled data
- information about strategic flood risk assessments
- information about this data
- information about flood risk activity permits
- help and advice

Not included in this document

This document does not include a Flood Defence Breach Hazard Map.

If your location has a reduced flood risk from rivers and sea because of defences, you need to request a Flood Defence Breach Hazard Map and information about the level of flood protection offered at your location from the Solent and South Downs Environment Agency team at ssdenquiries@environment-agency.gov.uk. This information will only be available if modelling has been carried out for breach scenarios.

Include a site location map in your request.

Information that's unavailable

This document **does not** contain:

- historic flooding
- climate change modelled data

We do not have historic flooding data for this location.

Please note that:

- flooding may have occurred that we do not have records for
- flooding can come from a range of different sources
- we can only supply flood risk data relating to floodng from rivers or the sea

You can contact your Lead Local Flood Authority or Internal Drainage Board to see if they have other relevant local flood information. Please note that some areas do not have an Internal Drainage Board.

There is not any modelled data available for this location. This is because detailed modelling hasn't been carried out in this area.

There is not any modelled climate change data for this location. This is because detailed modelling hasn't been carried out in this area. You will need to consider the latest flood risk assessment climate change allowances and factor in the new allowances to demonstrate the development will be safe from flooding.

Surface water and other sources of flooding

Use the long term flood risk service to find out about the risk of flooding from:

- surface water
- ordinary watercourses
- reservoirs

For information about sewer flooding, contact the relevant water company for the area.

About the models used

Model name: Romsey Model
Scenario(s): Defences removed fluvial,
Date: 2011

Terminology used

Annual exceedance probability (AEP)

This refers to the probability of a flood event occurring in any year. The probability is expressed as a percentage. For example, a large flood which is calculated to have a 1% chance of occuring in any one year, is described as 1% AEP.

Metres above ordnance datum (mAOD)

All flood levels are given in metres above ordnance datum which is defined as the mean sea level at Newlyn, Cornwall.

Flood map for planning (rivers and the sea)

Your selected location is in flood zone 1.

Flood zone 3 shows the area at risk of flooding for an undefended flood event with a:

- 0.5% or greater probability of occurring in any year for flooding from the sea
- 1% or greater probability of occurring in any year for fluvial (river) flooding

Flood zone 2 shows the area at risk of flooding for an undefended flood event with:

- between a 0.1% and 0.5% probability of occurring in any year for flooding from the sea
- between a 0.1% and 1% probability of occurring in any year for fluvial (river) flooding

It's important to remember that the flood zones on this map:

- refer to the land at risk of flooding and do not refer to individual properties
- refer to the probability of river and sea flooding, ignoring the presence of defences
- do not take into account potential impacts of climate change

This data is updated on a quarterly basis as better data becomes available.

Flood defences and attributes

The flood defences map shows the location of the flood defences present.

The flood defences data table shows the type of defences, their condition and the standard of protection. It shows the height above sea level of the top of the flood defence (crest level). The height is In mAOD which is the metres above the mean sea level at Newlyn, Cornwall.

It's important to remember that flood defence data may not be updated on a regular basis. The information here is based on the best available data.

Use this information:

- to help you assess if there is a reduced flood risk for this location because of defences
- with any information in the modelled data section to find out the impact of defences on flood risk

Strategic flood risk assessments

We recommend that you check the relevant local authority's strategic flood risk assessment (SFRA) as part of your work to prepare a site specific flood risk assessment.

This should give you information about:

- the potential impacts of climate change in this catchment
- areas defined as functional floodplain
- flooding from other sources, such as surface water, ground water and reservoirs

About this data

This data has been generated by strategic scale flood models and is not intended for use at the individual property scale. If you're intending to use this data as part of a flood risk assessment, please include an appropriate modelling tolerance as part of your assessment. The Environment Agency regularly updates its modelling. We recommend that you check the data provided is the most recent, before submitting your flood risk assessment.

Flood risk activity permits

Under the Environmental Permitting (England and Wales) Regulations 2016 some developments may require an environmental permit for flood risk activities from the Environment Agency. This includes any permanent or temporary works that are in, over, under, or nearby a designated main river or flood defence structure.

Find out more about flood risk activity permits

Help and advice

Contact the Solent and South Downs Environment Agency team at ssdenquiries@environment-agency.gov.uk for:

- more information about getting a product 5, 6, 7 or 8
- general help and advice about the site you're requesting data for

Appendix 7 - Drainage Calculations

Greenfield runoff rate estimation for sites

www.uksuds.com | Greenfield runoff tool

Calculated by:	Dani Lister
Site name:	Halterworth Lane
Site location:	Romsey

This is an estimation of the greenfield runoff rates that are used to meet normal best practice criteria in line with Environment Agency guidance "Rainfall runoff management for developments", SC030219 (2013) , the SuDS Manual C753 (Ciria, 2015) and the non-statutory standards for SuDS (Defra, 2015). This information on greenfield runoff rates may be the basis for setting consents for the drainage of surface water runoff from sites.

Site Details

Latitude:	50.98987° N
Longitude:	1.46809° W

Runoff estimation approach

FEH Statistical

Site characteristics

Total site area (ha): 8.35

Methodology

Q_{MED} estimation method:	Calculate from BFI and SAAR
BFI and SPR method:	Specify BFI manually
HOST class:	N/A
BFI / BFIHOST:	0.573
Q_{MED} (l/s):	
Q_{BAR} / Q_{MED} factor:	1.14

Hydrological characteristics

	Default	Edited
SAAR (mm):	788	788
Hydrological region:	7	7
Growth curve factor 1 year:	0.85	0.85
Growth curve factor 30 years:	2.3	2.3
Growth curve factor 100 years:	3.19	3.19
Growth curve factor 200 years:	3.74	3.74

Notes

(1) Is Q_{BAR} < 2.0 l/s/ha?

When Q_{BAR} is < 2.0 l/s/ha then limiting discharge rates are set at 2.0 l/s/ha.

(2) Are flow rates < 5.0 l/s?

Where flow rates are less than 5.0 l/s consent for discharge is usually set at 5.0 l/s if blockage from vegetation and other materials is possible. Lower consent flow rates may be set where the blockage risk is addressed by using appropriate drainage elements.

(3) Is SPR/SPRHOST ≤ 0.3?

Where groundwater levels are low enough the use of soakaways to avoid discharge offsite would normally be preferred for disposal of surface water runoff.

Greenfield runoff rates

	Default	Edited

Q_{BAR} (l/s):		29.5
1 in 1 year (l/s):		25.07
1 in 30 years (l/s):		67.84
1 in 100 year (l/s):		94.09
1 in 200 years (l/s):		110.32

Runoff estimation approach

FEH Statistical

Site characteristics

Total site area (ha):	7.2

Methodology

Q_{MED} estimation method:	Calculate from BFI and SAAR
BFI and SPR method:	Specify BFI manually
HOST class:	N/A
BFI / BFIHOST:	0.573
Q_{MED} (l/s):	
Q_{BAR} / Q_{MED} factor:	1.14

Hydrological characteristics

	Default	Edited
SAAR (mm):	788	788
Hydrological region:	7	7
Growth curve factor 1 year:	0.85	0.85
Growth curve factor 30 years:	2.3	2.3
Growth curve factor 100 years:	3.19	3.19
Growth curve factor 200 years:	3.74	3.74

Notes

(1) Is Q_{BAR} < 2.0 l/s/ha?

When Q_{BAR} is < 2.0 l/s/ha then limiting discharge rates are set at 2.0 l/s/ha.

(2) Are flow rates < 5.0 l/s?

Where flow rates are less than 5.0 l/s consent for discharge is usually set at 5.0 l/s if blockage from vegetation and other materials is possible. Lower consent flow rates may be set where the blockage risk is addressed by using appropriate drainage elements.

(3) Is SPR/SPRHOST ≤ 0.3?

Where groundwater levels are low enough the use of soakaways to avoid discharge offsite would normally be preferred for disposal of surface water runoff.

Greenfield runoff rates

	Default	Edited

Q_{BAR} (l/s):		25.43
1 in 1 year (l/s):		21.62
1 in 30 years (l/s):		58.5
1 in 100 year (l/s):		81.13
1 in 200 years (l/s):		95.12

Summary of Results for 100 year Return Period (+45%)

Approved Judgment

This judgment was handed down remotely at 10.30am on 17 January 2024 by circulation to the parties or their representatives by e-mail and by release to the National Archives.

.....

LORD JUSTICE LEWIS:

INTRODUCTION

1. This is an appeal against a decision of Lang J. ("the judge") refusing a claim for judicial review pursuant to section 118 of the Planning Act 2008 ("the 2008 Act") of two decisions of the first respondent dated 31 March 2022 to make development consent orders under section 114 of the 2008 Act for the construction, respectively, of the East Anglia One North ("EA1N"), and the East Anglia Two ("EA2"), Offshore Wind Farms with associated onshore and offshore development. The two development consent orders are the East Anglia One North Offshore Wind Farm Order 2022 and East Anglia Two Offshore Wind Farm Order 2022.

2. Both development consent orders authorise two nationally significant infrastructure projects ("NSIPs"), namely a generating station and associated grid connection and substation, and a National Grid NSIP comprising substation, cable sealing ends and pylon realignment. The project substations, and the National Grid NSIP, are to be located at Friston in Suffolk.

3. The appellant is a company limited by guarantee formed by a number of local residents in East Suffolk to represent communities in the area. There are significant concerns in the local community about the onshore location of the connection of the development to the National Grid. It is this element of the development which is the subject of the appeal; the appellant does not object to the offshore wind farms. The first respondent is the Secretary of State for Energy Security and Net Zero who made the development consent orders. The second and third respondents were the respective applicants for the two development consent orders.

4. Permission has been granted for two grounds of appeal. The first ground concerns the risk of surface water flooding at the development. The appellant essentially contends that the provisions of the relevant policies required the first respondent to be satisfied that a sequential test had been applied by the applicant when selecting the site for the proposed development. That test, it was submitted, required the applicant to locate the development in an area which was not at medium or high risk of surface water flooding unless there were no other sites reasonably available. The second ground concerns the assessment of cumulative effects of the development together with other potential projects. In particular, the appellant contends that certain projects (known as the "Nautilus" and "Eurolink" schemes) have been identified as projects which could connect with the new National Grid substation. An assessment of the effect of those two projects was included in an Extension Appraisal document supplied by the second and third respondents. The appellant contends that the first respondent should have taken that information into account when deciding whether to make the development consent orders but he did not do so. The judge dismissed both grounds of challenge. The appellant appeals against that decision on the following grounds.

   (1) The judge erred in her decision on the flood risk ground, namely:

      (a) she regarded the application of the sequential test in respect of flood risk as a lawful exercise of planning judgment, in circumstances where no "sequential" approach was applied at all; and

(b) she made a perverse error of fact in finding that no part of the site was in an area at high risk of surface water flooding, contrary to the evidence and agreement of the parties.

(2) The judge erred in her decision on the cumulative impacts ground namely:

(a) she erred in failing to recognise that the respondent was under a statutory duty to take into account the Extension Appraisal as environmental information and could not disavow it as an irrelevant consideration;

(b) she wrongly elided the potential effects of the Nautilus and Eurolink schemes with the potential effects of the National Grid substation to accommodate those schemes, which was the point in issue.

THE LEGAL FRAMEWORK

The 2008 Act

5. A detailed account of the provisions of the 2008 Act is provided by the Supreme Court in *R (Friends of the Earth Ltd) v Secretary of State for Transport* [2021] PTSR 190 at paragraphs 19 to 38. In essence, by section 31 of the 2008 Act, development consent is required for development "to the extent that the project is or forms part of a nationally significant infrastructure project." Section 104 applies in relation to an application for development consent where a national policy statement has effect in relation to that development. National policy statements are made under section 5 of the 2008 Act. Section 104 provides, so far as material, that

> "(2) In deciding the application the Secretary of State must have regard to—
>
> (a) any national policy statement which has effect in relation to development of the description to which the application relates (a 'relevant national policy statement')
>
> …..
>
> and
>
> (d) any other matters which the Secretary of State thinks are both important and relevant to the Secretary of State's decision.
>
> (3) The Secretary of State must decide the application in accordance with any relevant national policy statement, except to the extent that one or more of subsections (4) to (8) applies.

The National Policy Statement

6. The Secretary of State made an Overarching National Policy Statement for Energy (EN-1) in July 2011. Part 3 recognises the need for new types of energy infrastructure of the kind covered by EN-1 and provides that substantial weight should be given to the

contribution which such projects would make to satisfying that need. Part 5 deals with the assessment of generic impacts from such projects. The material paragraphs dealing with flood risk provide as follows (footnotes omitted):

> "5.7. Flood Risk
>
> Introduction
>
> …..
>
> 5.7.3 The aims of planning policy on development and flood risk are to ensure that flood risk from all sources of flooding is taken into account at all stages in the planning process to avoid inappropriate development in areas at risk of flooding and to direct development away from areas at highest risk. Where new energy infrastructure is exceptionally necessary in such areas, policy aims to make it safe without increasing flood risk elsewhere and, where possible, by reducing flood risk overall.
>
> Applicant's assessment
>
> 5.7.4. Applications for energy projects of 1 hectare or greater in Flood Zone 1 in England … and all proposals for energy projects located in Flood Zones 2 and 3 in England … should be accompanied by a flood risk assessment (FRA). An FRA will also be required where an energy project less than 1 hectare may be subject to sources of flooding other than rivers and the sea (for example surface water) … This should identify and assess the risks of all forms of flooding to and from the project and demonstrate how the flood risk will be managed, taking climate change into account.
>
> …..
>
> 5.7.6 Further guidance can be found in the Practice Guide which accompanies Planning Policy Statement 25 (PPS25), TAN15 for Wales or successor documents.
>
> …..
>
> IPC Decision Making
>
> 5.7.9 In determining an application for development consent, the IPC should be satisfied that where relevant:
>
> • the application is supported by an appropriate FRA;
>
> • the Sequential Test has been applied as part of site selection;
>
> • a sequential approach has been applied at the site level to minimise risk by directing the most vulnerable uses to areas of lowest flood risk;

> • the proposal is in line with any relevant national and local flood risk management strategy
>
> • priority has been given to the use of sustainable drainage systems (SuDs) (as required in the next paragraph on National Standards); and
>
> • in flood risk areas the project is appropriately flood resilient and resistant, including safe access and escape routes where required, and that any residual risk can be safely managed over the lifetime of the development.
>
> …..
>
> 5.7.12 The IPC should not consent development in Flood Zone 2 in England … unless it is satisfied that the sequential test requirements have been met. It should not consent development in Flood Zone 3 or Zone C unless it is satisfied that the Sequential and Exception Test requirements have been met …"
>
> The Sequential Test
>
> 5.7.13 Preference should be given to locating projects in Flood Zone 1 in England … If there is no reasonably available site in Flood Zone 1 … then projects can be located in Flood Zone 2 … If there is no reasonably available site in Flood Zones 1 or 2 then nationally significant energy infrastructure projects can be located in Flood Zone 3 … subject to the Exception Test. Consideration of alternative sites should take account of the policy on alternatives set out in section 4.4 above."

7. The reference to Flood Zones 1, 2 and 3 are references to the Flood Zones identified by the Environment Agency as areas with a low, medium or high risk, respectively, of fluvial flooding, that is flooding from rivers.

The National Planning Policy Framework ("the Framework")

8. The Framework in place at the time of the application for development consents had paragraphs dealing with flood risk. The Framework was amended in July 2021 after the applications in the present case were submitted. The material paragraphs dealing with the policy on assessment of flood risks is in the following terms (footnotes omitted):

> "Planning and flood risk
>
> 159. Inappropriate development in areas at risk of flooding should be avoided by directing development away from areas at highest risk (whether existing or future). Where development is necessary in such areas, the development should be made safe for its lifetime without increasing flood risk elsewhere.
>
> 160. Strategic policies should be informed by a strategic flood risk assessment, and should manage flood risk from all sources.

They should consider cumulative impacts in, or affecting, local areas susceptible to flooding, and take account of advice from the Environment Agency and other relevant flood risk management authorities, such as lead local flood authorities and internal drainage boards.

161. All plans should apply a sequential, risk-based approach to the location of development—taking into account all sources of flood risk and the current and future impacts of climate change—so as to avoid, where possible, flood risk to people and property. They should do this, and manage any residual risk, by:

(a) applying the sequential test and then, if necessary, the exception test as set out below;

(b) safeguarding land from development that is required, or likely to be required, for current or future flood management;

(c) using opportunities provided by new development and improvements in green and other infrastructure to reduce the causes and impacts of flooding, (making as much use as possible of natural flood management techniques as part of an integrated approach to flood risk management); and

(d) where climate change is expected to increase flood risk so that some existing development may not be sustainable in the long-term, seeking opportunities to relocate development, including housing, to more sustainable locations.

162. The aim of the sequential test is to steer new development to areas with the lowest risk of flooding from any source. Development should not be allocated or permitted if there are reasonably available sites appropriate for the proposed development in areas with a lower risk of flooding. The strategic flood risk assessment will provide the basis for applying this test. The sequential approach should be used in areas known to be at risk now or in the future from any form of flooding.

163. If it is not possible for development to be located in areas with a lower risk of flooding (taking into account wider sustainable development objectives), the exception test may have to be applied. The need for the exception test will depend on the potential vulnerability of the site and of the development proposed, in line with the Flood Risk Vulnerability Classification set out in Annex 3.

…..

167. When determining any planning applications, local planning authorities should ensure that flood risk is not increased elsewhere. Where appropriate, applications should be supported

> by a site-specific flood-risk assessment. Development should only be allowed in areas at risk of flooding where, in the light of this assessment (and the sequential and exception tests, as applicable) it can be demonstrated that:
>
> (a) within the site, the most vulnerable development is located in areas of lowest flood risk, unless there are overriding reasons to prefer a different location;
>
> (b) the development is appropriately flood resistant and resilient such that, in the event of a flood, it could be quickly brought back into use without significant refurbishment;
>
> (c) it incorporates sustainable drainage systems, unless there is clear evidence that this would be inappropriate;
>
> (d) any residual risk can be safely managed; and
>
> (e) safe access and escape routes are included where appropriate, as part of an agreed emergency plan."

9. As the judge explained at paragraph 60 of her judgment, paragraphs 160 to 163 apply to plan-making and site-allocation by local planning authorities. Paragraphs 167 applies to applications for development consents.

The Planning Policy Guidance ("PPG")

10. The PPG offers further guidance on assessment of flood risk. The material paragraphs are as follows:

> "7.002 What is "flood risk"?
>
> For the purposes of applying the National Planning Policy Framework, "flood risk" is a combination of the probability and the potential consequences of flooding from all sources – including from rivers and the sea, directly from rainfall on the ground surface and rising groundwater overwhelmed sewers and drainage systems, and from reservoirs, canals and lakes and other artificial sources.
>
> …..
>
> 7.018 **What is the sequential, risk-based approach to the location of development?**
>
> This general approach is designed to ensure that areas at little or no risk of flooding from any source are developed in preference to areas at higher risk. The aim should be to keep development out of medium and high risk flooding areas (Flood Zones 2 and 3) and other areas affected by other sources of flooding where possible.

Application of the sequential approach in the plan-making process, in particular application of the Sequential Test, will help ensure that development can be safely and sustainably delivered and developers do not waste their time promoting proposals which are inappropriate on flood risk grounds.

7.019 **The aim of the Sequential Test**

What is the aim of the Sequential Test for the location of development?

The Sequential Test ensures that a sequential approach is followed to steer new development to areas with the lowest probability of flooding. The flood zones as refined in the Strategic Flood Risk Assessment for the area provide the basis for applying the Test. The aim is to steer new development to Flood Zone 1 (areas with a low probability of river or sea flooding). Where there are no reasonably available sites in Flood Zone 1, local planning authorities in their decision making should take into account the flood risk vulnerability of land uses and consider reasonably available sites in Flood Zone 2 (areas with a medium probability of river or sea flooding), applying the Exception Test if required. Only where there are no reasonably available sites in Flood Zones 1 or 2 should the suitability of sites in Flood Zone 3 (areas with a high probability of river or sea flooding) be considered, taking into account the flood risk vulnerability of land uses and applying the Exception Test if required.

Within each flood zone, surface water and other sources of flooding also need to be taken into account in applying the sequential approach to the location of development.

…..

Para 7.033 **Applying the Sequential Test to individual planning applications**

How should the Sequential Test be applied to planning applications?

See advice on the sequential approach to development and the aim of the sequential test.

The Sequential Test does not need to be applied for individual developments on sites which have been allocated in development plans through the Sequential Test, or for applications for minor development or change of use (except for a change of use to a caravan, camping or chalet site, or to a mobile home or park home site).

Nor should it normally be necessary to apply the Sequential Test to development proposals in Flood Zone 1 (land with a low probability of flooding from rivers or the sea), unless the Strategic Flood Risk Assessment for the area, or other more recent information, indicates there may be flooding issues now or in the future (for example, through the impact of climate change).

For individual planning applications where there has been no sequential testing of the allocations in the development plan, or where the use of the site being proposed is not in accordance with the development plan, the area to apply the Sequential Test across will be defined by local circumstances relating to the catchment area for the type of development proposed. For some developments this may be clear, for example, the catchment area for a school. In other cases it may be identified from other Local Plan policies, such as the need for affordable housing within a town centre, or a specific area identified for regeneration. For example, where there are large areas in Flood Zones 2 and 3 (medium to high probability of flooding) and development is needed in those areas to sustain the existing community, sites outside them are unlikely to provide reasonable alternatives.

When applying the Sequential Test, a pragmatic approach on the availability of alternatives should be taken. For example, in considering planning applications for extensions to existing business premises it might be impractical to suggest that there are more suitable alternative locations for that development elsewhere. For nationally or regionally important infrastructure the area of search to which the Sequential Test could be applied will be wider than the local planning authority boundary.

Any development proposal should take into account the likelihood of flooding from other sources, as well as from rivers and the sea. The sequential approach to locating development in areas at lower flood risk should be applied to all sources of flooding, including development in an area which has critical drainage problems, as notified to the local planning authority by the Environment Agency, and where the proposed location of the development would increase flood risk elsewhere.

See also advice on who is responsible for deciding whether an application passes the Sequential Test and further advice on the Sequential Test process available from the Environment Agency (flood risk standing advice).

7.034 **"Who is responsible for deciding whether an application passes the Sequential Test?**

It is for local planning authorities, taking advice from the Environment Agency as appropriate, to consider the extent to

> which Sequential Test considerations have been satisfied, taking into account the particular circumstances in any given case. The developer should justify with evidence to the local planning authority what area of search has been used when making the application. Ultimately the local planning authority needs to be satisfied in all cases that the proposed development would be safe and not lead to increased flood risk elsewhere."

The Regulations

11. The Infrastructure Planning (Environmental Impact Assessment) Regulations 2017 ("the Regulations") apply to applications for development consent under the 2008 Act. Regulation 14 provides that an application for an order granting development consent must be accompanied by an environmental statement. Regulation 21 provides that:

> "21 Consideration of whether development consent should be granted
>
> (1) When deciding whether to make an order granting development consent for EIA development the Secretary of State must—
>
> (a) examine the environmental information;
>
> (b) reach a reasoned conclusion on the significant effects of the proposed development on the environment, taking into account the examination referred to in sub-paragraph (a) and, where appropriate, any supplementary examination considered necessary;
>
> (c) integrate that conclusion into the decision as to whether an order is to be granted; and
>
> (d) if an order is to be made, consider whether it is appropriate to impose monitoring measures."

12. Environmental information is defined in regulation 3 of the Regulations in the following terms:

> "environmental information" means the environmental statement (or in the case of a subsequent application, the updated environmental statement), including any further information and any other information, any representations made by any body required by these Regulations to be invited to make representations and any representations duly made by any other person about the environmental effects of the development and of any associated development".

13. "Further information" and "any other information" are then defined as follows:

> "'further information' means additional information which, in the view of the Examining authority, the Secretary of State or the

> relevant authority, is directly relevant to reaching a reasoned conclusion on the significant effects of the development on the environment and which it is necessary to include in an environmental statement or updated environmental statement in order for it to satisfy the requirements of regulation 14(2)"
>
> and
>
> "'any other information' means any other substantive information provided by the applicant in relation to the environmental statement or updated environmental statement"

14. Paragraph 5(e) of Schedule 4 to the Regulations provides that a description of the likely significant effects of the development on the environment include, amongst other things, "the cumulation of effects with other existing and/or approved projects".

15. In addition, paragraph 4.2.5 of EN-1 provides that when considering cumulative effects, an environmental statement should provide information on how the effects of the applicant's proposal would combine and interact with "the effects of other development (including projects for which consent has been sought or granted, as well as those already in existence)".

THE FACTUAL BACKGROUND

The Projects

16. The facts are set out fully in the judgment of the judge at paragraph 15 and following. The applications are described in the following terms:

> "15. The applications for development consent comprised an offshore element and an onshore element. The offshore element is for the construction and operation of up to 67 (in the case of EA1N) and 75 (in the case of EA2) wind turbine generators ("WTGs"); together with up to four offshore electrical platforms; an offshore construction, operation and maintenance platform; a meteorological mast; inert-array cables linking the WTGs to each other and to the offshore electrical platforms; platform link cables; and up to two export cables to take the electricity generated by the WTGs from the offshore electrical platforms to landfall. The proposed generating capacity was up to 800MW for EA1N and up to 900MW for EA2."
>
> 16. The onshore works in respect of both applications include landfall connection works north of Thorpeness in Suffolk, with underground cables running to a new onshore substation located next to Friston, Suffolk. The onshore works also include the realignment of existing overhead power lines and the construction of a new National Grid substation at Friston. The proposal is therefore that the Friston site will accommodate a substation for each of EA1N and EA2, and a new National Grid NSIP comprising a substation and cable sealing ends connected

> to the realigned overhead lines. The site at Friston extends to 46.28 hectares."

17. The judge describes the process by which the site for the proposed development was identified. Initially seven potential zones were selected including Friston. The process included scoping, a red/amber/green or "RAG" assessment and consultation. That was followed by a preliminary environmental report and a flood risk assessment. Zone 7, Friston, was selected as the onshore site.

The Applications

18. Applications for the two development consent orders were submitted on 25 October 2019. They were accompanied by an environmental statement. Paragraphs 124 to 132 dealt with flooding from surface water in the following terms:

> "124. The Environment Agency's Long Term Flood Risk Information map (Environment Agency undated) (**Figure 20.3.3**) shows the onshore development area is primarily in an area at primarily low risk of surface water flooding i.e. outside the extent of the 1 in 1,000 year surface water flooding event.
>
> 125. However, the National grid Substation National Grid CCS cable sealing end compounds and permanent access road are located in an area with varying risk of surface water flooding. The northern and western boundary around the National Grid substation, including the cable sealing and compounds, and part of the footprint of the National Grid substation, includes areas at both high risk of surface water flooding i.e. during the 1 in 30 year event and medium risk of surface water flooding i.e. there is a risk of flooding during the 1 in 100 year vent. This flood risk is associated with the drainage of surface water from the north in proximity to Little Moor Farm.
>
> 126. The onshore substation and onshore substation CCS are located in areas primarily at low risk of surface water flooding i.e. outside the extent of the 1 in 1,00-year surface water flooding event.
>
> 127. As part of the onshore substation and National Grid infrastructure a permanent access road will be built up to the north-east of Moor Farm, connecting to both the onshore substation and National Grid substation. In addition, permanent access tracks to the cable sealing end compounds will be built to the north of the National Grid substation. Parts of the access roads are likely to cross areas at both high risk of surface water flooding i.e. during the 1 in 30-year event and medium risk of surface water flooding i.e. there is a risk of flooding during the 1 in 100-year event (**Figure 20.3.3**).
>
> 128. The surface water flood risk extends downstream to Friston, where they have been several reports of historical

> flooding, as providing by local residents. Flood incident records as recorded by the LLFA are reported as having a low priority, and are generally located along the B1121 Saxmundham Road (Suffolk County Council 2018a and b).
>
> 129. Flood risk from surface water to the onshore substation and National Grid infrastructure and off-site as a result of the proposed East Anglia one North project will be addressed through the development of a detailed drainage design, the beginnings of which are provided in the Outline Landscape and Ecological Management Strategy (OLEMS), as secured under the requirements of the draft DCO, and submitted with this DCO application. Existing land drains will need to be reinstated and/or connected into the formal drainage network following construction.
>
> 130. A local specialised drainage contractor will undertake surveys, locate drains, create drawings pre- and post-construction, and ensure appropriate reinstatement. The Surface Water and Drainage Management Plan will include provisions to minimise flood risk within the working area and ensure ongoing drainage of surrounding land.
>
> 131. The Surface Water and Drainage Management Plan, as secured under the requirements of the draft DCO, will include Sustainable Drainage System (SuDS) measures. Further detail is provided in the OCoCP submitted with this DCO application.
>
> 132. Further details related to management of surface water flood risk and drainage for the onshore substation and National Grid infrastructure is considered within **section 20.7**."

19. On 25 March 2021, the second and third respondents provided the Extension of National Grid Substation Appraisal document. That considered the issue of other projects connecting to the National Grid substation, including the Nautilus and Eurolink projects. The document stated that it was not practicable to carry out a cumulative impact assessment as virtually none of the information about those projects that advice indicated should be considered was available. The document indicated that the only practical solution was to provide updated information about the only element of the projects about which there was any certainty. It therefore provided an assessment of that element of the projects but stated that it "is recognised that this represents only a partial assessment of those projects". Also on 25 March 2021, the second and third respondents provided a flood risk and drainage clarification note. That document noted that the possible presence of the surface water conveyance route had been identified since the early development of the projects. The second and third respondents proposed to retain it but redirect it around the northern perimeter of the substation such that it did not cause flooding.

20. In response to comments on flood risk, a further document was submitted on behalf of the second and third respondents in June 2021. That indicated that the site selection process "initially focussed on flood risk from fluvial sources". However, during site

selection, a surface water conveyance route was identified which partly passed through the northern perimeter of what was the proposed location of the National Grid substation. The response document noted the view of the second and third respondents that "the presence of a surface water flow route is in no way sufficient to discount a location from development". It noted that the National Grid infrastructure and substation were only minor contributors to the flow upstream of Friston and that they posed no significant flood water risk. It stated that:

> "From the outset the Applicants have committed to mitigating and managing surface water within the Order limits so as not to exacerbate flood risks to downstream receptors and the evidence supports that this is possible. In higher return period events, the Applicants anticipate the operational SuDS will provide a betterment to the existing surface water regime within the Order limits, in turn providing for both the Projects and the residents of Friston by containing excess surface water and ensuring it is discharged as a controlled rate.
>
> The Applicants have provided plans showing the locations of the indicative designs together with the calculations that support the sizing".

The Examining Authority Report

21. The applications were considered by an examining authority. It prepared two reports, one for each application, but it is agreed that it is sufficient to refer to the report on the EA1N application for the purposes of this appeal. The examining authority reported to the first respondent on 6 December 2021. Its report is detailed and comprehensive and should be read in full. For present purposes it is necessary only to refer to three parts.

22. First, in relation to the flood risk issue, the examining authority considered that, at the time of the submission of the application, the flood risk assessment complied with the relevant requirements of EN1 and the provisions of the Framework then in force and the PPG. However, it considered that the reference to risks from flooding from all sources was a significant change and that it would be in the interests of fairness to consult the parties on the implications of what it saw as a change in policy.

23. Secondly, it considered that the Extension of the National Grid Substation Appraisal documents demonstrated a significant worsening of adverse effects from certain viewpoints.

24. Thirdly, the examining authority's overall conclusion was to recommend that the Secretary of State grant development consent. As it said in its conclusions:

> "28.4.4. In the ExA's judgement, the benefits of the Proposed Development at the national scale, providing highly significant additional renewable energy generation capacity in scalar terms and in a timely manner to meet need, are sufficient to outweigh the negative impacts that that have been identified in relation to the construction and operation of the Proposed Development at the local scale. The local harm that the ExA has identified is

substantial and should not be underestimated in effect. Its mitigation has in certain key respects been found to be only just sufficient on balance. However, the benefits of the Proposed Development principally in terms of addressing the need for renewable energy development identified in NPS EN-1 outweigh those effects. In terms of PA 2008 section 104(7) the ExA specifically finds that the benefits of the Proposed Development do on balance outweigh its adverse impacts.

28.4.5. In reaching this conclusion, the ExA has had regard to the effect of the Proposed Development cumulatively with the other East Anglia development and with such other relevant policies and proposals as might affect its development, operation or decommissioning and in respect of which there is information in the public domain. In that regard, the ExA observes that effects of the cumulative delivery of the Proposed Development with the other East Anglia development on the transmission connection site near Friston are so substantially adverse that utmost care will be required in the consideration of any amendments or additions to those elements of the Proposed Development in this location. This ExA does not seek to fetter the discretion of future decision-makers about additional development proposals at this location. However, it can and does set out a strong view that the most substantial and innovative attention to siting, scale, appearance and the mitigation of adverse effects within design processes would be required if anything but immaterial additional development were to be proposed in this location.

28.4.6. In relation to this conclusion, the ExA observes that particular regard needs to be had at this location to flood and drainage effects (where additional impermeable surfaces within the existing development site have the potential to affect the proposed flood management solution), to landscape and visual impacts and to impacts on the historic built environment, should these arise from additional development proposals in the future.

28.4.7. The ExA concludes overall that, for the reasons set out in the preceding chapters and summarised above, the SoS should decide to grant development consent.

28.4.8. The ExA acknowledges that this is a conclusion that may well meet with considerable dismay amongst many local residents and businesses who became IPs and contributed positively and passionately to the Examination across a broad range of matters and issues. To them the ExA observes that their concerns are real and that the planning system provided a table to which they could be brought. However, highly weighty global and national considerations about the need for large and timely additional renewable energy generating capacity to meet need and to materially assist in the mitigation of adverse climate

> effects due to carbon emissions have to be accorded their due place in the planning balance. In the judgment of the ExA, these matters must tip a finely balanced equation in favour of the decision to grant development consent for the Proposed Development."

The First Respondent's Decision

25. The first respondent consulted with the applicants for development consent and other interested bodies and groups on the changes in the wording of the Framework which referred to taking account of "all" flood risks. In their response dated 30 November 2021, the second and third respondents noted that site selection, design and refinements of the projects had been an iterative process considering a range of matters. The site selection process had had regard to legislation and policy guidance. The locations identified were entirely within Flood Zone 1 and so on land at the lowest risk of flooding from rivers. Paragraph 8 of the response continued:

> "8. The onshore substation and National Grid infrastructure locations were also reviewed against the Environment Agency's surface water flood risk mapping and identified as being located in an area predominantly at very low risk of surface water flooding Furthermore, the National Grid substation location was selected in full cognisance of the presence of a shallow surface water flow route (comprising approximately 4cm of water depth during a 1 in a 100 year storm event), noting that such features can be diverted and their continued conveyance ensured using well established and proven techniques. A commitment to this is made within the ***Outline Operational Drainage Management Plan*** (OODMP) … along with a commitment to offset any reduction volume relating to other existing surface water features affected at the substation locations."

26. At paragraph 15, the document noted that the flood risk and drainage measures to be implemented for the projects would ensure that there was no risk of surface water flooding the infrastructure. The measures proposed would also ensure that there was no increased risk of flooding to the surrounding area and especially to Friston. Paragraph 22 and 23 of the document stated:

> "22. The revised focus of the wording in the NPPF and accompanying Planning Practice Guidance acknowledges the need to consider all sources of flooding; however, it does not provide any criteria for their assessment on their suitability in terms of location (similar to that provided for the flood zones and vulnerability of a development) which can be used to determine whether a development is appropriate or not.
>
> 23. While the Applicants have considered all sources of flooding, in the absence of any criteria as to how this should be implemented, they have sought to address the potential risk from surface water flooding by locating the onshore substations and National Grid infrastructure in an area at low risk of surface

> water flooding, and by adopting appropriate mitigation measures within the design to address any remaining surface water flood risk concerns."

27. The first respondent made separate decisions for each application but it is agreed that it is sufficient to refer to the decision on the EA1N application for the purposes of this appeal. The decision is detailed and comprehensive and should be read in full. For present purposes it is necessary only to refer to the following parts.

> "First, the decision letter deals with the responses to the change in the wording of the Framework in paragraph 4.27 and noted the following:"
>
> "4.27 The Secretary of State consulted on the issue of updates to the NPPF on 2 November 2021 and 20 December 2021, the key responses are summarised below:
>
> • SCC (the Lead Local Flood Authority)—the changes to the NPPF would require the Applicant to undertake a Sequential Test, and if necessary, an Exception Test. However, SCC acknowledge that as the PPG has not been updated, it is not clear how the Sequential and Exception Tests would be applied.
>
> • ESC—states that the reference in the updated NPPF has the potential to have important implications for the East Anglia ONE North and East Anglia TWO projects. However, they also acknowledge that as the PPG has not been updated, it is not clear how the Sequential and Exception Tests would be applied.
>
> • SASES—consider that it is clear from the Applicant's submissions that surface water and ground water were not taken into account during the site selection process and, consequently, the Sequential test was not properly applied. Additionally, SASES consider that the updates to the NPPF do not impose any new policy requirement but rather reinforce the existing requirements. SASES also reiterated that they considered the infiltration testing conducted by the Applicant was insufficient and had concerns about the Applicant's approach to applying the Sequential Test. Overall, SASES considered that because of the defects of the Applicant's approach, that policy requirements had not been met.
>
> • The Applicant—acknowledges that the updated NPPF is more explicit in the use of the term 'any source' of flooding but note that the criteria for the assessment and application of the Sequential Test remains unchanged, and that the PPG does not provide any criteria for the assessment of suitability of a location to determine whether a development is appropriate or not. The Applicant also highlighted:

> (i) they have considered all sources of flooding in the design of the Proposed Development;
>
> (ii) the substation site and National Grid infrastructure have been located in an area at low risk of surface water flooding;
>
> (iii) appropriate mitigation measures have been adopted to address any remaining surface water flood risk concerns;
>
> (iv) SCC had already given surface water flooding equal weighting when reviewing the Proposed Development's assessment of flood risk throughout the examination;
>
> (v) that the emphasis in the updated NPPF to move away from hard engineered flood solutions is not considered by the Applicant to be a fundamental change that would alter their proposed drainage strategy or adoption of SuDS measures;
>
> (vi) that the extensive landscape planting proposed would reduce the speed of surface water runoff compared to that currently experienced, as well as soil erosion and silt levels in runoff;
>
> (vii) modelling undertaken for the Friston Surface Water Flood Study15 confirms that surface water flooding within Friston primarily results from surface water flow from a number of locations unrelated to the substation site; and
>
> (viii) by attenuating surface water and ensuring a controlled discharge rate from the site there is no increase in flood risk to the surrounding area, specifically Friston."

28. The first respondent then set out his conclusions on this issue at paragraph 4.28 of the decision letter in the following terms:

> "4.28 The Secretary of State notes that all sources of flooding have been considered by the Applicant in the design of the Proposed Development, he also notes the surface water mitigation measures which the Applicant has proposed to address flood risk concerns. Furthermore, the Secretary of State has considered all the consultation responses relevant to the NPPF updates and, noting that the guidance on how the Sequential Test should be applied in respect of all sources of flooding has not been updated, is satisfied that the Applicant has (as it is currently defined) applied the Sequential Test as part of site selection. As such, the Secretary of State considers that the FRA is appropriate for the Application."

29. At paragraphs 4.47 and 4.48, the first respondent noted that he considered that the second and third respondents had applied the sequential test as part of site selection and the flood risk assessment was appropriate. Overall, the first respondent was satisfied

that the policy requirements had been met but even so the potential increased flood risk carried a high negative weight in the planning balance.

30. In relation to the Extension Appraisal document, the first respondent said this:

> "5.12 In response to significant concerns from a number of parties (including the Councils') about future projects, the Applicant submitted an Extension of National Grid Substation Appraisal. This Appraisal assessed the potential effects of extending the National Grid substation to accommodate future projects, including: Nautilus interconnector, EuroLink interconnector, North Falls and Five Estuaries offshore wind farms. However, the Appraisal states "it has been confirmed by both the proposed North Falls and Five Estuaries projects that they will not connect near Leiston.
>
> 5.13 The Secretary of State notes that the future projects considered are in the following stages of development:
>
> • Nautilus interconnector—National Grid Ventures requested a section 35 direction under the Planning Act 2008 on 4 March 2019, the Secretary of State received further information from National Grid Ventures on 4 April 2019 and a direction was made by the Secretary of State on 29 April 2019. The application is expected to be submitted to the Planning Inspectorate Q2 2023.
>
> • EuroLink interconnector—is a proposal by National Grid Ventures to build a HVDC transmission cable between the UK and the Netherlands. The capacity of the link will be 1.4 GW and the project is still in the very early stages of development. No information on this project has currently been submitted to the Planning Inspectorate or the Secretary of State.
>
> "5.14 Currently, the only documentation available on the Planning Inspectorate's website for the Nautilus interconnector project is the Section 35 Direction made by the Secretary of State for the proposed development to be treated as development for which development consent is required under the 2008 Act. The Eurolink interconnector project is earlier in the development consent process than Nautilus, and no documentation has been submitted to the Planning Inspectorate. Consequently, there is very limited environmental information available which would allow the Applicant to conduct a cumulative assessment. The Applicant's decision not to include these proposed projects in its cumulative effects assessment is also supported by the Planning Inspectorate's Advice Note Seventeen: Cumulative effects assessment relevant to nationally significant infrastructure projects. Paragraph 3.3.1 of the Advice Note lists the information required to conduct stage 4 of a cumulative effects assessment:

> • proposed design and location information;
>
> • proposed programme of construction, operation and decommissioning; and
>
> • environmental assessments that set out baseline data and effects arising from the 'other existing development and/or approved development'.
>
> "5.15 As none of the above information was available prior to the close of the East Anglia ONE North and East Anglia TWO examination period for either the Nautilus or Eurolink projects, the Secretary of State is content that it was not necessary for the Applicant to include these proposed projects in its cumulative effects assessment. Further details of the Secretary of State's position on the inclusion of these projects in the Applicant's cumulative assessment can be found in paragraph 12.14 of this document.
>
> "5.16 The ExA concludes that: 'The extension of National Grid Substation Appraisal demonstrates a significant worsening of potential adverse effects for relevant VPs [Viewpoints] and for landscape character. The extension of the NG substation would intensify and worsen the effects of the Proposed Development on both the local landscape and on visual receptors. Such an effect would be added to in an unknown way by the provision of required surface water drainage."
>
> "5.22 In reaching the above conclusions the ExA has not considered the Extension of National Grid Substation Appraisal, noting that the Applicant acknowledges that the Appraisal is 'environmental information' and is not intended to comprise a Cumulative Impact Assessment.
>
> "5.23 The Secretary of State agrees with the ExA's conclusions on Landscape and Visual Amenity."

31. The overall conclusion of the first respondent was that the case for development consent had been made out and the benefits of the proposed development would outweigh any adverse effects for the reasons given in section 27 of the decision letter. The first respondent therefore decided to make orders granting development consent for the two projects.

THE JUDGMENT BELOW

32. The judge dismissed the claim in a comprehensive and clear judgment. On the first matter that comprises ground one of this appeal, the judge's reasoning can be found in essentially three paragraphs. At paragraph 58, the judge said:

> "58. I agree with the submission made by the defendant and the applicants that, whilst NPS EN-1 refers to all sources of

> flooding, the specific guidance on the application of the sequential test only refers to the location of projects in different flood zones. Whilst flood zones are plainly relevant, they are designated on the basis of the risk of fluvial flooding, not surface water or other sources of flooding, and so they are not a sufficient means of assessing surface water flood risks. Therefore, it is a matter of judgment for an applicant, and ultimately the decision-maker, as to how to apply the sequential test to flood risks from other sources, such as surface water."

33. The judge then dealt with the arguments based on the Framework and the PPG. She concluded at paragraphs 64 and 65 that:

> "64. It is apparent that the Framework and the PPG require surface water flooding to be taken into account when considering location of development, as part of the sequential approach, but, beyond that, there is no further direction as to exactly how surface water flooding is to be factored into the sequential approach. Policy and guidance is not prescriptive in this regard. Therefore it will be a matter of judgment for the applicant and the decision-maker (as envisaged in para 7.034 of the PPG) as to how to give effect to the policy appropriately, in the particular circumstances of the case."
>
> 65. I accept the submission of the defendant and applicants that neither the policies nor the guidance support the claimant's submission that the application of the sequential test means that, where there is some surface water flood risk, it must be positively demonstrated that there are no sites reasonably available for the development with lower surface water flood risk."

34. The first ground of appeal also asserts that the judge made an error of fact in finding that no part of the site was in an area at high risk of surface water flooding. That assertion was based on paragraph 79 of the judgment where the judge said:

> "79. At DL 4.27, the defendant noted the applicants' position that all sources of flooding had been assessed with regard to the onshore substations, and that the wider area, including the village of Friston, would not be adversely affected. The substation and infrastructure were located in an area at low risk of surface water flooding, and appropriate mitigation measures had been adopted to address any remaining surface water flood risk concerns, by attenuating surface water and ensuring a controlled discharge rate from the site. There was no increase in flood risk to the surrounding area, specifically Friston."

35. On the issue material to ground 2 of this appeal, the judge's conclusions are set out at paragraph 197 to 203 in the following terms:

"197. I accept the submissions made by the defendant and the applicants that the approach taken by the defendant did not constitute a breach of the EIA Regulations 2017. The developments in question were not "existing and/or approved projects" in respect of which a cumulative assessment would be required by reference to paragraph 5 of Schedule 4 to the EIA Regulations 2017".

198. The Extension Appraisal did not constitute a cumulative impact assessment for the reasons set out in that document at 1.1. The two projects were at such an early stage that there was not sufficient reliable information to undertake a satisfactory cumulative assessment. That approach was in accordance with the guidance in Advice Note Seventeen.

199. The ExA and the defendant were entitled to regard the Extension Appraisal as "environmental information" but not "further information", as defined in regulation 3 of the EIA Regulations 2017 , as it was not "additional information which, in the view of the Examining authority, the Secretary of State or the relevant authority, is directly relevant to reaching a reasoned conclusion on the significant effects of the development on the environment and which it is necessary to include in an environmental statement … in order for it to satisfy the requirements of regulation 14(2)".

200. Like all other representations made by the applicants about the environmental effects of the development (ie "environmental information" as defined in regulation 3), the Extension Appraisal was carefully examined by the ExA, and fully taken into account by the defendant when making his decision. The issues of flooding and transport were considered in the screening assessment with the Extension Appraisal, but were not taken forward for further assessment.

201. The defendant was entitled, as the decision-maker, to disagree with the ExA's statement that satisfactory assumptions could have been made to allow the future projects to be included in the cumulative impact assessment, for the reasons he gave at DL 12.14–12.19. Furthermore, although the claimant relied upon the ExA's description of the decision as "finely balanced", the defendant took a different view and concluded that the applicants had a strong case (DL 27.7).

202. In my judgment, the defendant's approach cannot be characterised as irrational. He was entitled to agree, in the exercise of his judgment, with the applicants' case that the uncertainties about the future projects were such that it was not possible to undertake a reliable assessment of cumulative effects for the purposes of regulation 21(1)(b) of the EIA Regulations 2017.

> 203. Finally, I consider that the reasons given for the decision were clear and sufficient, and met the legal standard."

THE FIRST GROUND OF APPEAL – FLOOD RISK FROM SURFACE WATER

Submissions

36. Mr Turney, with Mr Bishop, for the appellant, submitted that the first respondent had misinterpreted the relevant paragraphs of EN-1, the Framework and the PPG. The relevant provisions of the policies applied to risks of flooding from all sources including surface water. The relevant paragraphs required a sequential test to be adopted in site selection. That test required consideration of whether there was an alternative site available with less risk of flooding. The aim was first to locate development away from areas of flood risk. Those areas were defined by the probability of flooding as appeared from Table 1 as defined in the PPG. The areas at risk of flooding from surface water was also to be assessed by the probability of flooding. Consequently, where there was some risk of flooding from surface water, it must be positively demonstrated that there were no other sites reasonably available for the development with a lower risk of flooding from surface water. Further, that issue had to be considered at the site selection stage, not at the stage of designing the project and deciding where within the application site particular infrastructure would be located or in deciding what mitigating measures might be adopted. Non-compliance with the sequential test meant that an application for development consent was not in accordance with EN-1 and the Framework. In the present case, it was submitted that it was clear from paragraph 4.28 of the decision letter that the sequential test had not been used when selecting the site for development but only at the design stage. Mr Turney relied on *R (Zurich Assurance Ltd (t/a Threadneedle Property Investments)) v North Lincolnshire Council* [2012] EWHC 3708 (Admin) and *Hale Bank Parish Council v Halton Borough Council* [2019] EWHC 2677 (Admin) as examples in other contexts of how a sequential test operated.

37. Mr Turney submitted that the judge was wrong in finding that the relevant paragraphs of EN-1, the Framework and the PPG did not provide a prescriptive approach to determining how the sequential test was to be applied to flood risks from surface water. Further, he submitted that the judge erred as she considered that the substation and infrastructure were located in an area of low risk whereas in fact the substation was located in an area of high risk of surface water flooding.

38. Mr Westmoreland Smith, with Mr Welch, for the first respondent submitted that EN-1, the Framework, and the PPG required that the risk from surface water flooding be taken into account when considering the location of development as part of the sequential approach but, beyond that there was no direction as to how the risk flooding from surface water was to be considered. That was a matter of planning judgment. In particular, he submitted, the sequential test did not require that where there was any risk of flooding from surface water then it had to be demonstrated that there are no other sites reasonably available. Further, the underlying aim was to address any risk of flooding from surface water. If any such risk could be addressed by a combination of location and mitigation, that would satisfy the policy aims. Mr Westmoreland Smith relied upon the judgment in *Wathen-Fayed v Secretary of State for Levelling-Up, Housing and Communities* [2023] EWHC 92 (Admin), [2023] PTSR 524. Further, the

judge had not made any error of fact but, if the judge had, such an error was immaterial as the decision-maker had not made any such error.

39. Mr Phillpot KC, with Mr Flanagan, for the second and third respondents submitted that, properly understood, the issue on the first ground concerned the application rather than the interpretation of the relevant policies. They required that the risk of flooding from surface water be taken into account but did not provide how that was to be done. There was no mechanistic approach required. In the present case, the first and second respondents had decided not to discount the sites where there was a risk of flooding from surface water but where there were other measures that could be taken to address that risk. The reference to design should be understood in that context. Design was in fact part of the selection process. In considering the risk from surface water flooding in the case of the sites eventually selected, the first and second respondents had considered that such risk as existed could be adequately dealt with. The relevant provisions of the policies did not require applicants for development consent to abandon a site because of a risk which was entirely manageable. Such an approach would serve no practical purpose.

Discussion

40. The principles applicable to the interpretation of national planning policy in the context of the 2008 Act were summarised by Lindblom LJ in *R (Scarisbrick) v Secretary of State for Communities and Local Government* [2017] EWCA Civ 787 at paragraph 19. In essence, statements of policy are to be read objectively in accordance with the language used, read in its proper context. It is important to distinguish between issues of interpretation of a policy (which is a matter for judicial analysis), and issues of planning judgment in the application of that policy (which are matters for the decision-maker subject to review on public law grounds).

41. Dealing first with EN-1, paragraph 7.5.3 identifies the aim of the policy as ensuring that flood risk from all sources is taken into account at all stages in the planning process to avoid inappropriate development in areas of highest risk and to direct development away from areas at highest risk. The applicant for development consent will be required to provide a flood risk assessment which "should identify and assess the risks of all forms of flooding to and from the project and demonstrate how these flood risks will be managed" (see paragraph 5.7.4 of EN-1). Paragraph 5.7.9 deals with decision-making. The decision-maker must be satisfied that the application is supported by an appropriate flood risk assessment and that what is described as "the Sequential Test" has been applied as part of site selection, and what is described as "a sequential approach" has been applied at site level to minimise risk by directing the most vulnerable uses to areas of lowest flood risk. "The Sequential Test" is then defined at paragraph5.7.13. That requires preference to be given to locating projects in Flood Zone 1. If there are no reasonably available sites in Zone 1, projects can be located in Flood Zone 2 and, if no reasonably available sites are available in that Zone, then consideration can be given to locating projects in Zone 3 subject to an exception test described later in EN-1. It is clear that the application of the sequential test is concerned with risks from flooding from fluvial flooding (i.e. from rivers). Zones 1, 2 and 3 are concerned with areas at risk from fluvial flooding (as appears, for example, from Table 1 to the PPG). They are not concerned with, and do not identify zones by reference to, the probability of flooding from surface water.

42. There are no provisions of EN-1 which require that, where there is a risk of flooding from surface water, an applicant for development consent must demonstrate that there is no site reasonably available with a lower risk of surface water flooding. EN-1 does not require such an exercise to be carried out. The decision-maker will have to be satisfied that a sequential approach has been applied at site level to minimise risk by directing the most vulnerable uses to areas of lowest flood risk. How that is to be achieved, and whether the decision-maker can be satisfied that that has been done, involves issues of planning judgment in the application of the policy in EN-1

43. Similar considerations apply to the relevant paragraphs of the Framework and the PPG. It is clear that the aim underlying the policy on planning and flood risk is to ensure that inappropriate development is avoided in areas at risk of flooding by directing development away from areas of highest risk (see paragraph 159). At paragraph 162, the Framework recognises that the "aim of the sequential test is to steer new development to areas with the lowest risk of flooding from any source" and also refers to development not being allocated or permitted if there are reasonably available sites in areas with a lower risk of flooding. That is a reference to the sequential test as defined in EN-1 and is applicable to areas subject to fluvial flooding. The final sentence of paragraph 162 deals with flood risk more generally and refers to the "sequential approach" being used in areas known to be at risk from any form of flooding. The provisions of the Framework do not, however, require an applicant for development consent to demonstrate that there are no other sites reasonably available if any part of the development is to be located in an area where there is a risk of flooding from surface water. The same is true of the relevant paragraphs of the PPG. Paragraph 7.019 of the PPG, by way of example, makes it clear that the sequential test is concerned with steering development to Flood Zone 1 (areas with a low probability of fluvial flooding), and only if no sites are a reasonably available in that Zone, should consideration be given to reasonably available sites in Flood Zone 2. I do not consider that the two authorities relied upon by Mr Turney, namely *Zurich Assurance* and *Hale* assist in the interpretation of EN-1 or the Framework and the PPG. Both cases deal with differently worded policies.

44. The judge was correct, therefore, when she said at paragraphs 64 and 65 of her judgment that it was apparent from the Framework and the PPG that the risk of flooding from surface water must be taken into account at all stages as part of the aim of avoiding inappropriate development in areas at risk and to direct development away from areas at highest risk. The decision-maker will have to be satisfied that a sequential approach has been applied at the site level to minimise risk and direct the most vulnerable uses to areas of lowest flood risk. How that is done, however, is a matter of planning judgment for the decision-maker subject to review on public law grounds. The relevant provisions of EN-1, the Framework, and the PPG do not require that wherever there is a risk of flooding from surface water, an application for development consent must demonstrate that there is no other reasonably available site with a lower risk of flooding.

45 The judge was also correct to find that the first and second respondents had considered surface flood water risk at all relevant stages of the process. That was considered in the preliminary environmental information report, the environmental statement and the various notes and documents provided by the first and second respondents during the decision-making process and referred to above. Furthermore, it is artificial to seek to separate out a site selection from a design stage on the facts of this case. The process

of site selection involved considering whether to select a site where particular parts of the infrastructure would be located in areas of lowest risk of flooding and where suitable mitigation measures would be adopted to address the risk of surface water flooding where parts were located in an area of higher risk. I accept the respondents' submissions that, provided the applicants for development consent ensured that the aim of preventing inappropriate development in areas of flood risk was addressed, that could be done by a combination of the location of parts of the project and by mitigation. The conclusion reached by the first respondent at paragraph 4.28 of the decision letter was not irrational or otherwise unlawful.

46 On the second part of ground 1, I do not consider that the judge made any factual error in the assessment of the evidence. In particular, I do not consider that the judge was under any misapprehension that all the infrastructure proposed as part of the development was in an area of low risk of flooding from surface water. By way of example, the judge specifically referred to paragraph 171 of the flood risk assessment submitted with the preliminary environmental information report which stated that the substation and infrastructure "are primarily in areas at low risk of flooding from surface water" but referred to areas which were at a medium to high risk (see paragraph 71 of the judgment). The judge referred to the flood risk assessment submitted with the environmental assessment (see paragraph 72 of the judgment) and that deals specially with the parts of the substation and infrastructure located in areas with varying risk. The judge set out paragraph 23 of the response to the first respondent's questions which stated that the second and third respondents had addressed the potential risk from surface water flooding by locating substations and infrastructure in a low risk area and by adopting mitigation measures to address any remaining flood risk concerns and that is reflected in paragraph 79 of the judgment. That paragraph identifies that there are two means by which flood risk is being addressed: location and mitigation. Mitigation is relevant because part of the infrastructure remains in areas of medium or high risk of surface water flooding. I consider, therefore, that the judge correctly understood the evidence and did not make any factual error in her assessment. In any event, it would not be material as it is clear that the decision-maker did not make any such error.

47 For those reasons, which are essentially those given by the judge, I would dismiss the appeal on the first ground

THE SECOND GROUND – ASSESSMENT OF CUMULATIVE IMPACTS

Submissions

48 Mr Turney submitted that the construction of a new National Grid substation would provide a suitable connection for other projects (notably the Nautilus and Eurolink projects). It was likely that the substation would need to be extended or otherwise altered to accommodate such connections. Mr Turney therefore submitted that the first respondent was required to consider the likely significant cumulative effects of the project for which development consent was granted with other possible projects. Failure to do so was a breach of regulation 21(1)(a) and (b) of the Regulations and was irrational. Further, the examining authority had erred when it said that it had not considered the information in the Extension Appraisal document noting that it was environmental information and was not intended to comprise a cumulative impact assessment. Mr Turney submitted that the judge erred by finding that the information was environmental information but not further information. The judge was also wrong

to elide the potential effects of the Nautilus and Eurolink schemes with the potential effects on the National Grid substation to accommodate these schemes. The effects of the extension of the substation had been assessed in the Extension Appraisal document and those effects should have been assessed.

49 Mr Westmoreland Smith submitted that there was no breach of regulation 21 as the Nautilus and Eurolink projects were not existing projects but only potential or future projects. Consequently, they did not need to be the subject of a cumulative assessment, given the wording of paragraph 5(e) of Schedule 4 to the Regulations. Further, the fact that information had to be examined under regulation 21(1)(a) did not mean that it was information that had to be relied upon when reaching a conclusion on the likely significant effects of the proposed development. It may well be that the information, on examination as here, did not relate to that issue. In so far as the appellant sought to rely upon the cumulative impacts of the projects that were the subject of applications for development consent and other potential projects, it was open to the first respondent to defer assessment of the impact of other potential projects if there was insufficient information to assess those other potential projects.

50 Mr Phillpot for the second and third respondents submitted that properly interpreted regulation 21(1)(a) required environmental information to be examined and regulation 21(1)(b) required the Secretary of State to reach a reasoned conclusion on the significant effects of the proposed development taking into account "the examination" referred to in relation 21(1)(a). Here the environmental information was not further information as it was not information directly relevant to reaching a reasoned conclusion. Further, the assessments in the Examination Appraisal document were not a cumulative impact assessment of the projects for which development consent was sought and other potential projects. The first respondent was entitled to defer consideration of the environmental impact of other potential projects where there was insufficient information available to conduct a cumulative impact assessment.

Discussion

51 The starting point is that the information at issue here does not relate directly to the projects that are the subject matter of the two applications for development consent. The impacts of each of those projects has been assessed. Nor does the information relate to the impact of all aspects of the Nautilus or Eurolink projects. As the Extension Appraisal document makes clear little or none of the information required for a proper assessment of those projects was available. Rather, the information related to the potential future expansion or alteration of the National Grid substation necessary to accommodate the two proposed projects.

52 Dealing with the Regulations, regulation 21(1)(a) requires the Secretary of State when deciding whether to make an order granting development consent to "examine the environmental information". Regulation 21(1)(b) provides that the Secretary of State must then reach a reasoned conclusion on the significant effects of the proposed development taking into account that examination.

53 Environmental information is broadly defined in regulation 3 as meaning (a) the environmental statement (b) further information (itself defined to mean additional information which is directly relevant to reaching a reasoned conclusion on the significant effects of the development) (c) any other information (d) any representations

made by a specified body and (e) and any other representations. It is that information which has to be examined under regulation 21(1)(a). It is the result of that examination which has to be taken account of when reaching a reasoned conclusion on the significant effects of the proposed development. Some of the environmental information may, on analysis, not affect any conclusion on the significant effects of the development. Some of the information would be relevant, as would be the case, for example, with further information which, by definition, is additional information directly relevant to reaching a reasoned conclusion on the significant effects of the proposed development.

54 In the present case, the first respondent was entitled to take the view that the information in the Extension Appraisal document was not material affecting his reasoned conclusion on the significant effects of the proposed developments (i.e. EA1N or EA2, which were the two projects subject to the application for orders granting development consent). First, he was entitled to conclude that the information was not further information as it was not directly relevant to reaching a conclusion on the effects of the development that was the subject of the applications for development consent. The information was relevant, if at all, in relation to the effects of two other potential developments (Nautilus and Eurolink) if, ultimately, they were connected to the National Grid substation.

55 Secondly, and most significantly, the question therefore is whether the information should have been considered as part of a cumulative assessment of the two projects subject to the applications for development consent and the other potential projects. The law on this is well-established. Where two or more linked sets of works are properly regarded as separate projects, the objective of securing environmental protection is sufficiently secured by consideration of the cumulative effects at the stage when the first project is assessed so far as that is reasonably possible. However, a decision-maker may defer consideration of the cumulative effects arising from future projects where, amongst other reasons, there was not any adequate information on which a cumulative assessment could be based: see *R (Larkfleet Ltd) v South Kesteven District Council* [2016] Env. LR. 76, especially at paragraphs 35 to 38, and *Pearce v Secretary of State for Business, Energy an Industrial Strategy* [2021] EWHC 326 (Admin), [2022] Env L.R. 4, especially at paragraphs 116 to 117.

56 The decision of the first respondent to defer assessment of the cumulative impacts of the two projects with other future projects (the Nautilus and Eurolink projects) was rational and lawful, as the judge found at paragraphs 190 to 193 and 198 of her judgment. There was inadequate information available to carry out a cumulative impact assessment.

57 In those circumstances, the first respondent did not act in breach of regulation 21(1)(a) and (b) of the Regulations. The information in the Extension Appraisal document was examined. However, the examination of that information did not affect the conclusion on the significant effects of the developments for which applications for development consent had been made, i.e EA1N and EA2. The information was not part of a cumulative impact assessment of those developments with other future projects. It was not further information directly relevant to the significant effects of the developments for which applications for development consent orders had been made. The information was, in truth, information relevant if at all to assessment of (some of the) effects of other potential projects. As such there was no breach by the first respondent of his

obligations under regulation 21(1)(a) and (b) and he did not act irrationally or unlawfully.

58 For completeness, it is not necessary in this case to consider whether a cumulative assessment needs only to be carried out on the effects of the development together with other existing or approved projects and if so, whether the Nautilus and Eurolink projects were such projects. There is an issue as to whether paragraph 5(e) of Schedule 4 to the Regulations, properly interpreted, only applies to such projects or whether it also applies to future or potential projects or whether policy guidance requires the effects of such projects to be included in cumulative impact assessments. It is not necessary to reach a conclusion on that issue here as, in any event, it was rational to defer consideration of the impact of those future projects to a later stage.

59 For those reasons, ground 2 is not established.

CONCLUSION

60 The relevant provisions of EN-1, the Framework and the PPG do not require an applicant for development consent to demonstrate that whenever there is a risk of flooding from surface water there are no other sites reasonably available where the proposed development could be located in an area of lower surface water flood risk. The risks of flooding from surface water are to be taken into account when deciding whether to grant development consent under section 104 of the 2008 Act. The way in which account is to be taken of that risk raises issues of planning judgment in the application of the relevant provisions of the policies. The judge was correct in her interpretation of the policy and in finding that there was no irrationality or other public law error in the way in which the first respondent dealt with this issue when granting development consent. The effects of other potential projects (which were not projects forming part of the developments forming the subject matter of the application for development consent) did not have to be the subject of a cumulative impact assessment before development consent was granted in the present case. The first respondent was entitled to defer consideration of the effects of the other projects as there was insufficient information available to make an assessment. Such information as was available on the likely effects of other potential projects was not relevant to the assessment of the significant effects of the projects forming part of the applications for development consent in the present case. I would therefore dismiss this appeal.

LORD JUSTICE WILLIAM DAVIS

61 I agree.

LORD JUSTICE COULSON

62 I also agree.

Enzygo specialise in a wide range of technical services:

Property and Sites
Waste and Mineral Planning
Flooding, Drainage and Hydrology
Landscape Architecture
Arboriculture
Permitting and Regulation
Waste Technologies and Renewables
Waste Contract Procurement
Noise and Vibration
Ecology Services
Contaminated Land and Geotechnical
Traffic and Transportation
Planning Services
